Whoa! Cecil, "rotation of the earth"??
You're holding a 1X3 callsign and if it's not a vanity callsign it means you're at General class or above. You should know better.

Even a small mirrored surface will appear bigger and brighter when reflecting adequate sunlight; similar to the way a flashlight shone at you in the dark appears much bigger than the actual lampbulb might suggest. As for someone reading it, they only have to *see* it's being sent-- Search and Rescue can then bring others in to read you, assuming extraction may be prolonged by difficult terrain,etc. Sure, if you couldn't be rescued post-haste you'd expect food,etc. to be dropped. But correctly sent (and read) it could allow other needed supplies as well. Imagine you had a companion with you who was diabetic: Along with food, insulin and syringes could be dropped as well that might save his life while you had to wait for extraction. There are many possible reasons-- imagine your own. Rotation of the earth is a non-issue as any plane low enough to read you would be more troubled by it's motion relative to you, rather than your rotation about the earth's axis.

This leads to the real value of CW: It's the only "language" that can be sent wireless, sound, light, or other uncoventional methods that allows for accurate, remote transmission and reception of data in even the most primitive and hostile enviorments and almost anywhere on earth.

Could you easily invent (make-up) another? Sure, but it would lack CW's international history, acceptence and usage. It simply has no real competition. Is it really necessary to pass a Morse test to use your VOX-capable ICOM for ragchewing with your buddies on the local net? Of course not. But like a lot of other things, from Boy Scout manuals to Mom's knitting skills, it represents a body of knowledge which is valuable in it's own right. It's not something to be thrown into the ash-heap of history lightly.

In 1987, my wife and I spent 5 days in a 3 room real-estate office with 30 other people in Cancun,Mex. when hurricaine Gilbert hit. The head of the NWS at that time classified Gilbert as category 5 (the worst) but said, "That's only because we don't have anything greater than 5 to put it into." 185+mph winds make life real simple, real fast. No, we weren't sending morse<grin>. If you haven't lived through nature as a catastrophe you can have little idea of just how fast all these tech. toys we "need" can just melt away. If I ever again have to worry about survival you can be sure I'll bring a radio before I bring a computer and my old Boy Scout manual rather than " Word 5.0 for Dummies", etc. Think about it.

Respectfully,

Andrew

How do you do a full CPU reset on an Eagle Spitfire 454? A friend has one which is hung in some strange state where it just makes a buzzing sound and none of the buttons work. It has had the channel expansion mod applied and was working OK, then locked up when he was cycling through the channels.

Thanks in advance,
Bill

I fly SAR. I haven't heard of Morse being used in a rescue since I was
a cadet in the early 1970s (and THEN it was a "tale from long ago"). In
fact, the only time I ever saw it used was in the movies.

VORs and VORTACS still ident with code, but even back in the mid 1960s they used a recorded voice. I still remember " . . .Pomona . . .V-O-R . . ." and wondering if the guy ever got bored.

Just for you newbies, that ident changed to ". . .Pomona . . .VORTAC . . ." in about 1968.

My point was (is) I've been using International Morse Code for 48 years and I cannot read Morse code sent by a hand mirror reflecting the sun. How the heck are you going to tell me you need help? (I'm not saying a CW transceiver might not come in handy.)

> Could you easily invent (make-up) another? Sure, but it would lack CW's
> international history, acceptence and usage. It simply has no real competition.

Mirrors, telegraph sounders, and tapping on pipes in Morse code cannot be read by the great majority of hams so it is virtually useless when used in that manner. (Flashlights at night and CW transceivers might be useful.)

> ... it represents a
> body of knowledge which is valuable in it's own right. It's not something to be

Neither does it have supernatural powers. The Morse code that hams can read depends on lengths of audio tones. You are simply not good enough with a hand mirror to send dits and dahs to me across a couple of miles.

> Think about it. Andrew

The Navy used to include a mirror in the aviator's survivor kit. It had an X in the center that you could see through. There was a procedure were you aimed the mirror at the sun and held up the other hand and projected the X on the palm of that hand. I don't remember the exact procedure but you somehow lined up the X in a certain way and then rotated the mirror so you could see the object you are trying to signal and the sunlight would be reflected directly at it. The rotation of the earth would have no effect as long as you kept the alignment unless you signaled until it got dark.

This is very nice, Robert, but now re-do it without the dashes.
You cannot send a dash when you are tapping on a pipe. I contend
that most hams cannot read Morse code when it is made up of nothing
except dots, e.g. telegraph sounder code. I know I can't.

You really "blow " me away! <wink>. Maybe it's not that I'm not
good enough to send it, maybe you're just not good enough to read it.
Perhaps if I was sending it visually by reflecting the sunlight off a little
MFJ QRP-"Cub" you could read it better: That's a CW transciever,
I believe-- and mighty primitive to boot too. Heck, if the Russian
submariners had had them they coulda banged on the walls of the sub
with the little things.

If the professor said this he is correct.

Collector voltage has very little effect on Collector Current within the normal operating range of a transistor. Constant current sources are based on this principle. The current through a transistor is equal to the beta of the transistor multiplied time the base current. As long as there is enough applied voltage to overcome the various voltage drops in the transistor and produce a current that is greater than or equal to beta times base current the collector current will remain relatively constant. Usually though the base is biased from the same source the collector gets its voltage from so when you vary the collector voltage the base current varies also. This results in a corresponding change in collector current. However if the base current is held constant changing the collector voltage has very little effect. This is also the reason when you collector modulate an amp you have to modulate two stages. Try modulating one stage and you will only get about 10% modulation.

Can anyone tell me why the two companys have radios that look alike?
I even found drawnings on Galaxys site with Rangers Logo. What's up
with that? I'm interested in the Ranger 696FSSB. Any info would help
me.
Thanks,
Arby

Actually, I wondered about this too. The answer would be to vary
the spacing between characters and/or the tone. For instance, if you're
banging with a pipe, Y ou bang the end of the pipe to send a dit and the
broad(length) of the pipe to send a dah. How would they receiver know
which is which? A simple S-O-S would be all the clue you needed.

Wow now this is interesting, so you are saying that the signal only radiates from the shaft?! What? Holy Tollio! So are you saying that antenna with the coil on the base of the shaft is actually doing a diservice? So how do they work if it "chokes" of the signal at the base, for lack of a better word. :) I guess what I am trying to say is, doesnt the shaft (L) start making up for the half wave length and is radiation resistance?And what you saying is; the coil is inductive and is ohmic resistance? So it is this ratio of loss that concerns me, and that it can be effected by the position of the inductive load that is interesting, very interesting Toll. I may have to look at my home brew copper coil antenna in a whole new light.

Doc,

I gave it shot using #12 copper house wire (casing stripped), a 1" pvc tee and 2 copper setscrew wire anchors. I also used a slight mod on the ground plane (let me know what you think.) The vertical was as you described, 2 ground plane wires at about 45 degrees down as described, a 3rd ground plane wire straight down (about 1 foot off of the ground.)

I was only able to get the antenna (the pvc tee) about 10 feet above the ground, putting the top of the vertical at about 18 1/2 feet.

The SWR was fine with a 1:2(or 3) to 1 at 40 and 1:1(or 2) at 1. The range seemed to fine for the design with 5 or 6 miles on AM with traffic, and about 25 miles on SSB without traffic. I did notice that this seemed directional along the lines of the ground plane. Is that as expected. If I added 2 other ground plane wires perpendicular to the existing 2 would that make that more omnidirectional?

Any thoughts? And again, thanks for the original suggestion. I received a number of emails pointing me to some great sights. I'll

advance to some of those over time. Yours was a great starting point.

I am looking for a 148 or similar chassis for the car.
Dynascan chassis "no china 148S !
Local transaction in NYC or Long Island/Queens area.

But you said:
> ANY COIL OF WIRE WILL ACT AS A CHOKE TO ANY FREQUENCY. It is the
> amount of INDUCTIVE REACTANCE at that frequency that we are
> concerned with.

So, by your definition, an inductance that impedes even 0.001% of
a frequency is "choking" it. If I cut off 0.001% of your oxygen,
would I be "choking" you?

In electronics, the common usage of "choke" refers to an inductor
used to block frequencies. That is, an inductor which presents a
high impedance to the design frequency. All inductors do not qualify
as chokes. In order to be an audio choke, an inductor would have to
be a much higher inductance than one which would qualify as an RF
choke.

You missed the point. Chokes and inductors are not synonymous.
A choke is a particular type of inductor. A choke is an
inductor that presents a high impedance to the design frequency.

You don't design resonant circuits with chokes. You use them
to block frequencies.

I can't stands no more. This whole string got started with the question of whether the base-loading coil radiated on presumably a shortened quarter-wave. The short answer, yes it do but not all that well. Both the coil and the antenna itself are in the magnetic field business but for slightly different purposes. Continuously loaded antennas do radiate, after all, and rather well at that. The good Mr. Franklin seems to have left that out (for good reason in most cases) and caused a bit of confusion.

First off, the good James Clerk (pronounced Clark in the old country) Maxwell proved well enough to build a whole industry on it that when you move an electron, you get a static and magnetic field. Move a magnetic field and you get moving electrons and the lights come on. These three items go together like three drunks weaving down the road with their hands in each other's back pockets. The moral to this story is that nothing happens in a pure form anywhere, ever.

An inductor works by coupling the current-related magnetic field to neighboring turn(s) and opposing changes in current flow -- current lags voltage in an inductor. To the extent that no inductor is perfect, yes some radiation occurs. Similarly there is some inductance in a straight piece of wire, one of several reasons why an electrical quarter-wave is not a physical quarter-wave.

Envision a perfect quarter-wave at the instant a transmitter is turned on. The first electron out of the chute makes it to the tip just as the cycle reverses. If the antenna is too short, electrons start piling up at the end and these anti-social creatures start fighting each other but particularly the newbies coming in. Kind of sounds like the plates of a capacitor doesn't it.

So a bright soul discovered or reasoned that a lumped inductance -- a coil -- can be put in the antenna to slow down current flow and make a six-foot antenna look like 8 or 9. Because the magnetic field is a function of current, the base of the antenna is the place to go both for mechanical reasons but also because current flow is highest at the base and you get more bang out it. There are occasionally reasons to put it in the middle but it takes twice the coil to do the job because only half the current exists at the midpoint of the antenna. There is a slight advantage in theory to center-loading but the mechanical problems usually cause people to give up the extra six feet of range. That a coil in an antenna will somehow allow it to resonate on multiple frequencies is simply ridiculous.

Now I have to give GSEVEN credit for asking precisely the right questions. There ain't no such thing as a free lunch and this process is not totally without some disadvantages. One of these is simple dc resistance in the coil. It was the custom among dubious manufacturers to use the smallest wire possible in a coil to fake out SWR bridges (nothing has a better SWR than a 50 ohm resistor). When someone put power to one of these, the resulting burn-out could be spectacular. So keeping the dc resistance of a loading coil at a minimum is well worth the effort to keep heating down to a gentle belch.

Shortening also lowers the radiation resistance of the antenna system. If you envision the antenna system as two series resistors, one being radiation resistance and the other the accumulated dc resistances in the system, good old Ohm's Law will tell you that you want to minimize goofy resistances. It will also tell you when to settle for reality rather than perfection as well; otherwise we would all have gold antennas (gold is the best conductor). Copper may or may not be overkill and may or may not justify the mechanical complication of using a soft metal but it does respond to the basic questions.

One of the great fiascoes in the ARRL Handbook some years ago was an extreme top-loaded vertical called a DDRR with a radiation resistance of about half-an-ohm. The writer of the article advocated having it bent at your friendly local muffler shop rather than use the copper pipe the US Navy preferred. It took a while before it was pointed out that the ratio of radiation resistance to dc resistance gave his antenna a really bad radiation efficiency.

A swinging choke was one of a minor arsenal of devices to help the regulation (i.e. voltage swings under varying loads) in power supplies in the days of high-vacuum (and hi forward resistance) rectifiers and fairly expensive caps. The solid-state diode and capacitor manufacturing techniques have both sent swinging chokes and filter chokes in general to the dustbin of history. The ability of inductors to store energy in a

magnetic field comes in pretty handy in transformers, ignition coils, and switching power supplies so they ain't dead yet.

Terminology in electronics gets a bit weird. And a lot of logic on this group falls in with "Fire Engines are red and rushin' so all firemen are communists." So while an inductor can be used as a 'trap' or choke, not every inductor is one. A loading coil is an inductor; in no way shape or form is it a choke.

Dick

> provides INDUCTANCE.

Wait a second. You emphasized CHOKE. CHOKE is not from the reference;
it is a word that you added.
Nowhere did these references say "choke". Now all of a sudden, you are
calling them chokes. All of these references and not one referred to
the coils and inductors as chokes. Yet you somehow take the liberty
to equate the two with no apparent basis.

But let's go on and see what the other references said.

> ARRL Handbook, 1985 20.46, Table 20.19 "Approximate Values for 8 foot
> mobile whip" Loading L in uH is called for the coil L1 (which is a the

Not typically. It depends on the antenna length and coil location.
Typically, the point of maximum antenna current is at the feedpoint.

Doc is correct.

Antennas have voltage maxima at the OPEN ends (not the feedpoint).
Now, take your neon light and place it at the feedpoint.
Ooops! No light! What happened to your voltage maximum?
Answer: there is no voltage maximum at the feedpoint; there is
(typically) a current maximum at that point.

They are very similar to the 2510. They were modified for ham band only use by removing the LSB and AM. They didnt just pull parts though, they redesigned the boards so you can't just replace the missing parts and turn it into a 2510. You can easily add 11M and LSB to it.They can even be modified for AM but the rx is not very sensitive like this. This can probably be overcome with a good pre-amp. I did not try. I saw several selling at a recent hamfest for about $50. The one bad thing about it is the final transistor. It uses an MRF477 that is no longer made. They are still around for a premium price, sometimes as much as the cost of the radio. Stock they put out about 25 watts PEP on SSB. They can be modified by replacing the final and driver to put out more power. I have seen one doing 90 watts PEP. I can't help but think this was what they had in mind when they built it given the size of the heatsink on these radios. I used one for quite a while until the final went out then I used it with a TEN TEC transverter on 2 meters. I finally junked it when the uP board went out.

>
> Toll Free

'j' (or 'i') is indeed imaginary. It is a mathematical term
representing the square root of negative one --> sqrt(-1).
What is the real number which equals the square root of negative one?
Answer: there is none.

Impedances are complex numbers which consist of two components:
the real component and the imaginary component.
Complex numbers can be plotted on a two-dimensional plane called
the complex plane. This plane consists of two axes: the real axis
and the imaginary axis. The Smith Chart displays both the real
and imaginary components of an impedance; it is a form of the
complex plane.

From my experience, the misinformation of imaginary numbers
comes RF tinkerers who fail to understand the underlying math
of the principles they employ. Typically, they are ham operators
who think that their ham license is the equivalent of an
engineering degree and the ARRL Handbook is their Bible.
Interestingly, they try to tell you that you need to study more
and read more and understand more. I guess that means that you
have to memorize the ham license test questions to achieve
full knowledge and nirvana in the field of RF.

He never made any such claim. He said the 'j' (or 'i') term was
imaginary and he was correct. The Smith Chart does indeed support
his claim.

But since you claim to know better, give us the real value for the
square root of negative one. That is what 'j' is.

[snip]
> I have had several folks in here not understand that a loading coil

There is nothing magical about a choke. It is just an inductor. Choke is "how" it is used. The same coil of wire could be used to load an antenna or make paralell or series resonance circuits.

Yes, if it is space properly. Same as they use to read it when using telegraph sounders (clicks) instead of a tone.
tap, tap, space, tap, space, tap, tap, space, tap = C
tap, space, tap, tap, space, tap = EIE
Even Boy Scouts used to learn it this way.

Well you would not try or even need to send code with a mirror to signal you needed help. The reason SOS was chosen is because it is easy to recognize the pattern which is in three's. So any signal that comes in three's is considered to be a call of distress, three flashes of light, three gunshots, three bangs on the pipes repeated three times, ect.

what does lazy have to do with it??? CW does NOT indicated that you are
lazy or not, or what level of inteligence you might be at. The vast
majority of Hams agree that CW went out with the dinosaurs.

fact is they are of the group that wants everything for nothing
> they were never taught to be responsible people.

you prove by this statement that CW does not garentee to keep low lifes from
getting licenses! This six-pack mentality is only shared by racist old
farts and trailer park trash.

i for one hope cw

At least it won't put you to sleep like listening to a couple of verry old
senile hams on say the 6meter or 70cm bands!

Just out of curiosity, what happens if you cascade low pass filters ? e.g. if I put two in series, would it reduce intereference more than using one alone, or would I start attenuating the "wanted" signal ? (I don't have TVI, it's just something I was thinking about).

Richard.

The "lazy morons" are already transmitting illegally. What makes you think keeping the cw test, or making it harder is going to change things? IMHO there is no connection between the two. Its like if there were lots of people driving cars without drivers lincenses and the DMV tried to correct the problem by making the test for drivers licenses harder.

My 2 cents

I still contend that most hams cannot read telegraph Morse code
including myself. All that tapping would sound like a foreign
language compared to dit/dah tones.

If both of the LPF's were the same make and model then out of band rejection would be doubled as well as in band insertion loss would also be doubled. Typically a decent LPF has less then .5db in band loss. You could run two in series and never notice any real on-the-air difference. What is usually done is to have one LPF between the rig and the linear and another one on the output of the amp.

> MFJ QRP-"Cub" you could read it better: That's a CW transciever,

No doubt a CW transceiver would be much much better than a mirror
assuming someone who knows CW hears you. I would much rather trust
an unlocked transceiver capable of transmitting CW, SSB, AM, or FM
on all frequencies including the local emergency frequencies.

I just don't believe the average ham can read audio telegraph code
much less visual telegraph code.

So you are depending on someone knowing the above and recognizing that
it is a distress signal? I sure would hate for my life to depend upon
such. My unlocked transceiver will run indefinitely on batteries charged
by solar panels. And yes, I have spares of everything. I don't expect
ever to need CW. IMO, anyone who relies solely on CW to save his life
needs to have his life insurance paid up.

Sure, the easiest way would be to decrease the "mic gain" (via the "mic gain" control) on your rig. Also, if you are using a power mic, you can do the same by reducing the gain on the microphone.

Don't waste your time. He did have part of his problem correct,
he has no idea why 'semantics', the name of an object defining it's
purpose, is important. If you call a loading coil a 'choke', why
not call a ground rod a philbert? I'm still waiting for his 'cat'
to bark...

see if you guys put as much effort into learning the code as pissing and moaning you would have it all behind you. sorry kid thats the breaks. i would rather see ham radio disappear then slowly watch it go to hell for the sake of a few whiners and mfgrs that want to put a few extra bucks in their ass pockets.as far as old fart while most of us giving the resistance to your little movement are in our 40's so you will have to put up with us for quite awhile

Eric then what is a "trap" in regards to a multiband antenna?
Every antenna the tip is the point of highest voltage and the base is the highest current. Firestick antennas do nothing more than any other antenna doesnt do high voltage at the tip.
If you actually think by winding 22 feet of wire on an antenna makes it a 5/8 wave you are a gullibale person.

What I want to know is, what in the world does CW have to do with
citizens band radio? And why do you "hammers" even want to come over
here and associate with us bottom feeder cb'rs? I bet if we went
over to your "ameture" newsgroups and started talking cb you would
have a cow. Just something to think about.

Yes... the filters would be additive in their reduction of unwanted signals.
It goes without saying that they would also have some signal attenuation
associated with them... but probably not enough to cause any problems.

It would be slow and difficult and rather impractical but not impossible to make the flashes one for dit, two quick flashes for dah, but when you are in distress and all you want to do is attract attention you just want a signal of some kind. SOS comes in threes, three letters, three dits and three dahs so three flashes of a mirror, three gunshots, ect. mean I need help.

Bassman,

Your comments reminded me of an incident that happened to me 15 years ago. I got caught in a snowstorm leaving Charlotte, NC in my car. I was on I-85 south driving cautiously at about 35-40. There were 3 of us in tandem, and I was monitoring the CB so I could duck off the slab if there was a wreck ahead. Four 18 wheelers passed us in a row in the hammer lane throwing snow all over the cars (including me). This pissed me off, and I had a few choice words to say about "hotdog" truck drivers under my breath. It made me even madder that these guys were talking about how "dumb" 4 wheelers would slide and cause the trucks to wreck, and how we could not drive in snow. Just a few yards down the road (I don't know what happened--we were the only cars within 1/4 mile) suddenly, there were 4 trucks going to the 4 winds. Two went completely round in the road jacknifing violently. One's cab was badly damaged. Another truck scooted off to the right and up a bank, twisting its frame at a crazy angle. The other one took the median and cleaned out a ditch --also twisted at a wild angle, its front axle cocked at a really steep angle.

The three of us cars--you know, the ones who couldn't drive in the snow quickly came to a stop, sitting there watching this spectacular show from a distance. I thought--hmmmm, THIS is where I get off. I ain't stayin' on any road with wild people. There was an exit convenient to where I stopped, and I made like Snagglepuss the Tiger, exiting quickly STAGE RIGHT! I couldn't resist, so I picked up the mike and said, "You cowboy truckers think you know it all--HAHAHAHAHA!" I already knew they weren't hurt, or I wouldn't have said that. I snickered all the way home. It served those 4 smart asses right.

The moral of the story is this: Unfortunately, we ALL often have this I-Can-Drive-Better-Than-Anybody-Else-On-The-Road syndrome. And it is NOT foreign to truck drivers. I drove trucks for 5 1/2 years, saw some really idiotic moves by cars AND trucks. I had enough scares to tell me trucking was NOT for me--some caused by cars, some by other trucks. I went to the railroad. I often hear truckers grouse about cars, as if the roads should be turned over completely to trucks, and if they had their way, they'd just run over those 4 wheelers and crush them. Sadly, there have been some terrible wrecks on I-85, especially during the time when it was being widened thru here. Some were caused by stupid moves in cars. Some of the worst were caused by trucks who, not paying atten-tion, ran up on construction traffic, and slamming at full tilt into cars killing whole families. A number of drivers didn't survive these crashes or rollovers when some of them swerved to miss the jam. The point here is NOT to slam truck drivers, but to remind ALL of us that

we are ALL people. When a trucker gets down from that cab, he is just like the rest of us, most likely hopping in a car or pickup to make the trek home.

Lastly, there is another condition that occurs in snow season. Have you ever heard the remark, "I'm not afraid to drive in the snow--it's the "OTHER" guy I worry about!"? Again, we often seem to take on that "I-Am-The-Only-One-That-Can-Drive-In-The-Snow" attitude. Surely, that tells us--at least it does me--that that "ME" syndrome crops us when the white stuff is falling. I am not the greatest driver in the snow, and if I can, I'll stay at home. There ARE bunches of idiots out there on the ice. I am amazed when required to drive on snow or ice at the peo- ple who zip past me at 60+ when there is black ice on the road. And they get angry at me if I'm not willing to do the same thing. They think their SUVs are invincible and that 4-wheel drive will grip no matter what. Boy, do they get surprised when they end up in the ditch, or their Jeep spins around facing the other way. The bottom line is, no matter what you are driving, slow DOWN, avoid heavily traveled super slabs (the nuts are out there speeding!), and don't make sudden moves. Now, I'll hush! I'm gritting my teeth at the onslaught from truckers that's sure to follow!

James,

The domestic stations who do this are taking a real risk! While FCC can't stop every illegal station out there (sadly), they DO pay a lot of attention to such goings-on. I read about a few (such as the guy in Jupiter, Fla) who are wishing they hadn't done it. The Fla. guy first got an NAL for $20,000 which he ignored. A couple of months ago, the US Marshals paid him a visit and "invited" him to avail himself of their accommodations. Now he's facing $10,000 PER offense and, perhaps, a jail sentence.

The other thing that makes this risky is that the hams will do a "fox hunt" and turn the offender in. And, of course, they might run a few high-powered CW QSOs right on top of the guy. And there's no recourse the fellow would have being that he is illegal to start with. It is really sad, tho, that people think that they have to have ALL the spectrum there is. As to the hams being P.O.ed, can you really blame them? What if some entity came onto 11 meters with 1 million killowatts and jammed the entire band so nobody could use it? Wouldn't the people trying to use 11 meters be pissed? Sure. I know that's a wild analogy, but it is true that the hams get really torqued to be on 10 meters and hear, "How 'bout hit, skipland (echo, echo, echo, echo), ya got a copy on this h'yar 891 Sideband-BEEP!" LOL!

Jerry

Couldn't agree with you more Tyrone!
These freakin morons we got in ham radio
bitched to keep the obsolete code right up
to last year as a requirment. Now that they
and the hobby is dying like leaves on a fallen
tree you can hear them singin the blues for
their "beloved ham radio". Ha Ha Ha ! ! !
I can't wait till the FCC gives away another nice
chunk of their RF spectrum in the VHF/UHF bands
to wireless services. Boy-oh-boy will they scream
like stuck pigs in a pen when that shoe drops!

From: Express Electronics <sales@exportradios.com>
Message-ID: <8ppb0lrur1@slb1.atl.mindspring.net>
Source record: 51613

There are actually two different 2950DX models, if you purchased it from an amatuer radio outlet, it may very well be one of the DX1 which is intentionall made so it can not be converted. The CPU is not the same as the the DX2, which can be converted, and is often sold through different companies. Ranger USA sells the right radio to the right distributor to keep everybody happy. Unfortunately a lot of customers didn't know they were buying a radio that couldn't possibly be converted.

It depends, there are some that can not be modified, but most the new ones will be convertable. If it is a recent model it will need the special Ranger 2950DX plug-in gadget.

Wow, such a lively debate, I wonder if it is legal too. To be quite honest our lawyers have debated that one quite frequently, but the law seems to be a bit vauge and ambiguous, which you have pointed out. We called numerous FCC offices and received different answers, and then on the few occassions we have actually gone to court concerning our importation, all the Feds cared about was if (or if not) we paid our taxes for incoming products. The bottom line should be what do you personally want to do in life, Talk on the radio, or debate trivial points of law. We sell radios, our lawyers debate trivial points of law, and our customers are always very happy with their export radios. Everyone is happy on this end, enjoy your export radios, we do.

Anyone know where I can purchase a ear speaker/mic w. remote P-T-T part no. WTA-9 to fit a Maxon model HCB-30A 40 channel CB/weather radio? I tried the generic Radio Shack brand; the earphone worked but the mike connection did not so it did not transmit.

thanks for your help.

I've marked two statements in the above. Take a good look at them
both. After consideration, do you think you might make up your mind?
These two statements contradict each other. Care to explain your
apparent confusion? Or, are these chokes sentient, and able to make
up their own minds about what they are supposed to be doing? Exactly
how ~do~ they determine the frequencies of AC they let pass, and

those
they stop? Or, do they pass and stop anything? You seem to have
granted
them some magical powers, so... enlighten us.

on
> this principle.

Look at a constant current sheet. It gives variables based on both the BE
and CE junctions.

If you increase collector voltage on an amplifier, and keep the drive level
the same, the current draw goes up exponentially.

This was mathematically proven in the past.

Ask either Professor or Bill Eitner. They both did the experiment and
posted results.

A choke is a coil of wire

A trap is a coil of wire.

What is the difference both physically and mechanically?

>
> > Or a trap doesn't have a choking ability?
>
> That is correct.

No?

Let me take a dual band antenna that has a trap midway up the element.

I will remove the coil.

I will put the output of a signal generator on it.

I will measure the level on a dual trace o-scope.. One side to each
channel.

When I find the point at which the coil is completely (for all intents and
purposes)
eliminating the signal, it isn't behaving as a choke?

Now, if I reinsert it into the antenna and do the same test, the frequency
will change,
due to the change in L and C added by the other antenna elements.

Been tested, been proven.

It is if the electrical length of the radiating element is less
than 1/4 wavelength.

Also, regardless of the overall length, the current is only
maximum at the bottom of the coil (as you claim) under certain
specific conditions.

Your claim was much more general than this and, as such, cannot
be considered always true -- not even under typical conditions
(I'm not talking about oddball scenarios).

With a top loaded antenna, there is no way you can claim (as you do)
that "THE POINT OF MAX CURRENT IN THE ANTENNA [is concentrated]
AT THE POINT OF THE CHOKE/COIL/INDUCTOR."

This is simply not true. But maybe you can cite more references
that do not in any way support your claim (as you have before).

> What is the difference both physically and mechanically?

A choke is an inductor that presents a high impedance at the
design frequency and to all frequencies around that design
frequency due to its broadband, non-resonant nature.

A trap is a parallel resonant circuit designed to block a
specific frequency.

The difference is significant.

> > > Or a trap doesn't have a choking ability?
> >
> > That is correct.

No.

You mean you "will remove the trap." "Trap" and "coil" are
not synonymous.

> I will put the output of a signal generator on it.

> channel.
>
> When I find the point at which the coil is completely (for all intents and
> purposes) eliminating the signal, it isn't behaving as a choke?

No. You are applying your misdefinition of choke.
A choke has a broadbanded, non-resonant high impedance to the
design frequency. The trap, which is a parallel resonant circuit,
does not exhibit the same properties.

Your example is like comparing a capacitor with 25 ohms capacitive
reactance to an inductor with 25 ohms inductive reactance. They

both pass the same current for a given applied voltage and frequency
but they are not the same; they are nowhere near the same.

I would like to add my 2 cents to ham radio. I believe there are a lot of good people that would be interested in the hobby including myself if it was not for all that red tape. I got into CB because all I had to do was go to Kmart buy a CB and talk away after hooking it up. Also I do believe it would invite trouble makers like on CB if ham did the same. But also kind people as well, and you will have to take the good with the bad. If I'm having trouble talking to somone because anouther is being rude all I have to do is cut off the rig and give him a call on the phone if its important. Or I can go watch TV or play on the computer. I bet if people had to take a bunch of tests and fill out all kinds of paper work and then wait several weeks to get a permit to talk on the telephone, very few would have them. Anouther thing I would like to say is I read like in the post below about kids not being interested. A lot of complaints I hear is about kids playing with radios. Not on this NG but out in public and on the air waves.

P.S this post is not directed to the post below but to all posts on the subject.

****
A top-loaded antenna (Marconi or DDRR or somesuch) does not generally have
an inductor in it at all. It could have one, an ordinary loading coil, but
it doesn't have to have. Top loaders usually use capacity hats. What am I
missing here?

??

Yes, and you just changed the rules. What I stated was for a constant curent to the base as I so stated. AC by its nature is not constant.You are talking about a varing signal going into the non linear region of the transistor and even driving it deep into cutoff for at least 50% of the time. These are hardly normal operating parameters of a transistor. Yes under these conditions voltage will effect the average curent through the transistor. As you increase or decrese the voltage all of this added current is not going to ground through the transistor. Hopefully you are also increasing power and sending it to an antenna or dummy load. Your test did account for this, didn't it? Actual instantaneos values of current will still be equal to the beta of the transistor times the the base current with the voltage having little effect. Notice I did not say no effect. Transistors are not perfect. They have their internal resistances, capacitance and inductance. Of course hanging on a lot of inductance ,capitance and resistance in the form of an amp effects conditions a lot too. How did your test account for these? If the professor was talking about and amp having constant current regardless of voltage he was dead wrong. But that is not what you said. That is however what your test proves. You are testing the amplfier not the transistor. Don't take my word for it , go to the library and do an author search on Veatch. He wrote a very nice text book on transistor theory that uses at the worst 6th grade math and grammar. This means most any High School graduate should be able to comprehend it.
Since you are into experiments try this. Take a 2n2222 and connect the emitter to ground. Bias the base with about 2ma of base current while monitoring the collector current supplied by a variable power supply. This will be probably 200-300 mils or dont worry about the actual base current and just adjust it for say 250 mil of collector current with 12volts on the collector. A couple of dry cells and a 5K pot and a 1 k fixed resistor in series will suffice for the bias circuit. Now vary the collector power supply from 4 to 20 volts and tell us how much the current changes. This is verifying the action of the transistor not an amp. BTW the transistor will an internal resitance of about 25 ohms that is a constant resistance and not part of the action of the transistor(remember I said they are not perfect) Almost all the current change can be attributed to this imperfection. Also if you lower the voltage to the point where it is operating in its non linear range you will get an appreciable change in current. You can tell when you are ther because as you lower the voltage you will begin to get a very sudden drop in cuurent as you get below 4 volts.

The professor should have stuck to his guns his statement that the current through a transistor remains constant reqardless of collector voltage is true. This is true for the device not the amp. He gave in to testing the whole amp with all of its added inductances capacitances and resistances and taping at least half the power off to a load.

Sounds like someone visited the Firstick site and actually bought into their BS. If all it takes is voltage you can generate megavolts with only a few watts of power and we would not need linears.

To effect an 11 meter conversion on one of the new surface mount 2950 DX radios you would need to purchase and then install what they call an ' Export Board '. Installation would require a simple plug in procedeure. This would give you an 8 mhz spread covering 24 mhz flat thru 32 mhz.

Well, I'm trying to show the extreme case where the coil is as high as possible. I mean "top-loaded" in the sense that the coil is mounted high. Yes, "top-loading" does refer to using hats with or without a coil; I'm referring to the condition with a coil.

It's moot since very few people know code.

If you can save your own life and a bunch of other hams,that's cool.

But please don't get upset if I decode not to be rescued. The thought
of spending the rest of my days in a fallout shelter...with a bunch of
procode hams is very disturbing to me.

>
The tapping on the hull was decoded....

"Get us the F$%K out of here comrade!"

Maybe they could teach Flipper code. Flipper could tap out a question
from the media by using a coke bottle.

"How Do You Feel."
"Are you bummed that the soviet tv transmitter tower will be fixed long
before we recover your bodies?"

Did some ham really call you "Eieecil" or "Ceeie"?

How do they make those smiley faces with dat dot and dits code?

My friend is a deejay...he decoded some morse code in one of John
Lennon's last songs...
"I love you Yoko"
My friend got on the news for that.

All this talk about dead soviet submariners, code and John Denver made me want to reflect with nature. I took a walk down to a very nice beach in Pacific Grove Ca. John Denver's plane crashed there a few years ago. As I sat on a rock and gazed over the ocean I heard tapping.
tap
tap,tap,tap

On and on it went and then I realized I was hearing morse code. I pulled out this oldclipping from boys life magazine about the cave men and their morse code. It was a little decoder chart.

Tap,tiptapatiptapatptaptaptap.

I then saw the fiesty sea otter swimming on his back with a shellfish on his tummy and a rock in his claw.

"tap tap tapataptaptaptap!!!!!!!!!"

"What Do you want Mr. Otter?" I said.

The otter tapped back.....

"Do you have any cocktail sauce dude?"

It's basically a "stripped down" 2510. It has only CW and USB modes.
While it can be easily modified to cover 11 meters in the same fashion
as the 2510, the mods to gain back the missing modes are extensive, and
not very cost effective. Unless you truly want it for 10 meters and are
satisfied with only CW and USB, I'd pass on the HTX, and look for a used
2510.

John Doe wrote:
> ... I believe there are a lot of
> good people that would be interested in the hobby including myself if it was
> not for all that red tape.

The "red tape" is to validate the qualifications, minimum as
they may be. The important thing and one to which I am
comitted is to have the "red tape" (i.e. the test requirements)
be justified and the reduction of code testing to 5 wpm
is but one step towards that aim. The code test will
not likly go away completely until there is a change in the
international treaty. I believe your comment is not intended
as a desire to have NO ham requirements, and I hope you
concur that rational and justifiable requirements (that red
tape) are the reason ham radio is not CB.

>I got into CB because all I had to do was go to
> Kmart buy a CB and talk away after hooking it up.

But hams can actually build, repair and adjust their
own radio equipment which is not something CB oerators
can legally do. Hams are allowed HIGH power (1500
watts) while CB is limited to 4 watts. Those two aspects
justify the need for the red tape.

> Also I do believe it would
> invite trouble makers like on CB if ham did the same. But also kind people
> as well, and you will have to take the good with the bad.

Sorry, I must adamently disagree with that prospect. As much
as I oppose the need for morse code testing, I am equally
committed to NOT turning ham radio into a no test CB type
access.

> If I'm having
> trouble talking to somone because anouther is being rude all I have to do is
> cut off the rig and give him a call on the phone if its important.

Do you have the phone numbers of every ham available? That
points out another major CB vs Ham difference. Ham radio is
global and not limited to short distance rudeness.

> Or I can
> go watch TV or play on the computer. I bet if people had to take a bunch of
> tests and fill out all kinds of paper work and then wait several weeks to

> get a permit to talk on the telephone, very few would have them.

Probably so, but there is NO need for a license to
use the phone because there is NO public need for
anyone to have a license.

Additionally, the phone companies look after
all the problems for which you and I pay
monthly costs and per call usage fees.

Cheers,
Bill K2UNK

Gunner,
Since we are all speculating here... what if the person is running high power and is blasting through his neighbor's TV? You know how cranky folks can get if they can't watch..."So You Want To Be A Bazillionoire". We had asomeone in our neighborhood whose radio was so bad it came through on my son's Electric guitar.
Now that was strange.
Russ
PS
If you are going to play, at least be subtle

Hi Group,
I got a question. I have talked on SSB from my Uniden PC122 all the way across the country and into some others. It is a stock radio. Am I interferring with the HAMs by doing this. If I wanted to get licensed for HAM where should I start? What is the best way to go for occasional use and emergency communications, 2meter,etc. ??? I want to be legal and not P.O. anyone. Any help appreciated, thanks in advance.

And the 11 meter CB band is the perfect example of what happens when no one has to invest any effort in being allowed to operated on the air. Guess you would like the ham bands to become the sewer pit of the air waves that 11 meter is too. He obviously feels that getting a ham license isn't worth the little trouble it takes to study some theory and learn some rules and regulations and be willing to abide by those regulations. It is that "red tape" that separates the ham bands from CB. And yes you can point to some bad operating by hams on the ham bands but that is limited to a few frequencies, but tune ANY of the CB channels and you will find bad operating practices. I am not sure by what you mean the hams don't use *nearly* all of it, the bands sound pretty full to me and so what, it is allocated to the amateur service so if you want to make use of it get off your butt and be willing to put in a little effort and get a license instead of crying because it isn't free. Try stepping out of the welfare mentality for a change.

As long as you are on the legal CB channels you will not interfere with ham radio or any other service. You can find information at Radio Shack about getting your license or try the ARRL website at http://www.arrl.org The no-code tech license is a good way to start, this will give you access to 2 meters and other VHF bands.

Source record: 51646

There is 1, maybe 2 channels in my area that cater to "bad operating practice"...and I live in an extremely populated and very active cb community compared to most other metropolitan areas, the exceptions you can count on one hand.
Yep, that is exactly what the cb band is...a place where one can get on the air with virtually no effort and no experience needed. What a great thing. The hammies around here are not what you would call very active. I hear plenty of activity, but the majrity are not local. The ones that are local can usually be found on 11 meter with their modded high end rigs. Of course, there is always that sweet G spot in between the bands that cater to what ALL the other bands lack.

5256. Re: N9VKS: Indiana ham arrested for having a scanner

I have found bleedover can be cured in most situations on 11 meter.
The equipment is usually secondary to the person causing the
interference..whether through ignorance or malice. If you can deal with
the operator you can usually come to terms with a mutual agreement that
benefits both parties.

I think your on to something. Just a few days ago I noticed something
interesting too. Sometimes my dog will go to the door and bark.
There seems to be a pattern to it?

I know he is trying to tell me something so I recorded the barks,
transfered them to dots and dashes on my computer and converted them
to morse code. I must solve this problem. The dog is getting pretty
frusterated. He has started crapping in the floor over it.

I need to find a good ham operator who can help me decypher this. I
feel I am on to a major discovery that could possibly be a huge
scientific breakthrough in interspecies communication. Any help would
be appreciated and remember, I do this in the spirit of fun ;-)

Of course it could if it was prearranged and practiced. But, out of
the blue, I seriously doubt that I would associate a scrape or three
very rapid taps with a 'dah'. Hams who think telegraph code and
radio code are interchangeable simply have not thought about the
subject in any depth. Hams who are staking their lives on being
able to communicate by tapping on something or using scrap pieces
of metal to reflect sunlight are virtually unprepared for emergencies.

No wonder the dog is frustrated. Ain't met one yet with a decent fist.
When they tell him he sounds like crap, he hits your floor but you just
aren't getting the message. Buy him a decent automatic keyer.

Sea otters, on the other hand, have a pretty identifiable Banana Boat Roll
but a good op can catch their meaning. They can't copy worth a damn if you
use a Bug.

I believe you can still have the rules with out all that red tape. If I wanted to I could go through all that trouble to get my ticket and still act like an donkey on the air. once they found me then it would be over. But I just dont see how the red tape is going to stop the affenders. What you need is more enforcement. Like maybe let the local police help out when their are complaints, if the FCC does not have the manpower. and Yes the knowledge to tune your own radio would be helpful but their will always be people that will do that for you for a few bucks. As for the telephone yes the phone company would deal with morons. and the gov. would deal with them on the air. and we all know how they love to spend money.

<< 24 mhz flat thru 32 mhz. >>
<< Do you know if/where these boards would be available? Bear in mind this would be used for
"receive-only" purposes, of course. ;-) >>

So you want to transmit from 24 to 32 MHz. Flat, huh. Hey. I just had a great idea. How about having the FCC turn CB enforcement over to a private organization (say, the ARRL). And when they catch you and your RCI 2950DX out of band, they fine your ass $10,000? (Oh, you were just "receiving" with it? Shore, we understand. That'll be only $5,000 fine, then)

Bear in mind the profits from fines (and there would be considerable profits once they got inta the swing of things, fellers) would get distributed among ARRL members and ultimately be used for "educational" purposes, of course. ;-)

First I never said anything about requiring anyone to build a radio, but if you are going into a hobby that allows you to do so and put it on the air, you need to pass certain minimum requirements that you have some knowledge of what you are doing. How about not requiring a driver's license or age limit to drive a car, just let anyone go buy a one and get on the road, no testing of highway rules or driving skill. Do you have a driver's license or did you think it just wasn't worth the trouble. If you think the requirements for getting a ham license is not worth it to you, fine, I have no problems with that, but don't whine and cry because it isn't going to be given to you just because you don't want to meet some minimum requirements.

Not if you are talking on SSB within the normal operating range of a stock,
FCC approved radio your not.

If I wanted to get licensed for
> HAM where should I start?

Try ARRL's webpage.

What is the best way to go for occasional use and
> emergency communications, 2meter,etc. ???

IMO, CB is the best for what you are talking about. If you have fun talking
on side-band and are doing it legally, then that sounds good to me! However,
now that the restrictive Morse code requirements have been lifted and you
only need to learn 5 wpm of code, you may want to check out becoming a ham.
It's what has kept me from becoming one. Now I don't have an excuse! ;-)

<snippage>

Having a radio go through a guitar amp isn't all that strange. The guitar player in my band (back when I was a wanna-be rock star) had that happen a couple of times. Once was a police car several hundred yards away, came through clear as a bell. The other time I know of was either a cell phone or (more likely) a cordless phone. I forget the brand name, but it was a large tube amp. So it isn't unheard of. By the way, he lived about 400 yards away from me in the middle of nowhere (we were the closest neighbors to each other) and I ran 100 watts at HF, and it never came through his amp. He would have told me if I was, he knew I was a ham.

The cost to add LSB is the cost of a switch and small cap(47pf?). You do need a freq counter but it can be done without it. Takes about an hour or two to do the mod most of which is spent taking it apart and putting it back together. If you can find one for the right price I would go for it. Makes a nice SSB only radio.

The CB got it's reputation from the movies.
Short of some glamour movie with hams tapping away to save the
president; I doubt relaxed rules would cause a mass exodus to ham bands.
It just won't happen.

You have semi controlled access to you repeaters, you can police that
can't you? The cost of gear is enough to keep most lowlifes from the cb
away.

The vast majority of those in the professional communications business
are starting to view hams as spectrum hogs.

> I believe you can still have the rules with out all that red tape.

I must still disagree as the range of permitted aspects of amateur radio transend the possibility of a "no license" approach. High power, build your own equipment, etc. all demand more than just a "mail in your name/address" approach to licensing.

> If I wanted to I could go through all that trouble to
> get my ticket and still act like an donkey on the air.

Yes you could, but that doesn't happen anywhere near as much as can be found in a no license arrangement.

> once they found me then it would be over. But I
> just dont see how the red tape is going to stop the affenders.

It matters not IF it does or why it does. The reality is that on a comparitive basis, amateur radio (a licensed and tested service) has far less rule breakers than does CB radio. So it isn't a matter of debating IF licneses and license testing will stop offenders, it is absolutely the case that it does. Is it 100% perfect? Not at all, but it has a far better track record than CB does.

> What you need is more enforcement.

The FCC already lives with their CB nightmare as to rules enforcement and has pretty much abondoned enforcement except in the most egregious (sp?) cases...usually of interference. Ham radio has its own (small) group of offenders, but they are much easier to find and reel in by the FCC.

> Like maybe let the local police help out when their are
> complaints, if the FCC does not have the manpower.

The LAST people you want enforcing radio rules is your local police. The local police have ZERO knowledge of such enforcement and they have no real interest in getting involved anyway...(far more glory in solving homicides and drug busts than radio interference complaints).

> and Yes the knowledge to
> tune your own radio would be helpful
> but their will always be people that
> will do that for you for a few bucks.

The fact remains that hams are allowed to make
those adjustments themselves and that is one
reason for testing. No testing, no allowed use
of self tuned equipment. What you are proposing
is a different type of service. Perhaps you
should try GMRS, FRS, etc.

> As for the telephone yes the phone
> company would deal with morons. and the gov.
> would deal with them on the
> air. and we all know how they love to spend money.

If THEY means the FCC, the fact remains that
the FCC has a limited budget and ham radio
generates NO government revenue to pay for
any enforcement.

The other names you see on the faceplates of the radios signify the
importer.

Supposedly the Galaxy DX series of radios are somewhat different from stock
in that the Galaxy tech has redesigned and increased the tolerance that
Galaxy will accept the chassis under.

All the same radios... Different importers.

Since it has no memory, disconnect power, with the power switch on for about
10 minutes.

This will drain all capacitors in the radio.

No, they are rated at 100 watts PEP.

RF Parts rates them at 120, since they use a higher voltage than Toshiba
does for testing (Tosh = 12 volts, RF Parts = 13.8 I believe)

>.....you get 5000 .....you

No, I don't get 5000 watts out of a 2879. I can see around 325 watts.

Some others on this newsgroup have seen more than twice that, and have the
PEP values as well as the avg values to substantiate that claim, as well as
the AVG current draw to prove it.

> a bad man sell me a 16 -pill for 600.00 bucks then.....im not arguing or

volt
> up?

Any Texas Star can be volted with little to no money being put in it. Or,
any OTHER 16 pill amplifier.

I bought my 16 pill for the same price, knew the entire history of the amp,
and am completely happy with it.

My point was that their are others out their.

> Yes, and you just changed the rules.

No, I didn't.

What I did was tell people to go look at a thread from the Professor where
he told everyone that he had been wrong and performed a test, and posted
the results.

If what I did was change the rules, what you did was post something
completely
off topic, only serving to confuse those reading!

What I stated was for a constant curent to
> the base as I so stated. AC by its nature is not constant.You are talking
about

their
> internal resistances, capacitance and inductance. Of course hanging on a
lot of
> inductance ,capitance and resistance in the form of an amp effects
conditions a
> lot too. How did your test account for these?

Ask Brian. He did the test.

When I did mine, I applied a 20 watt carrier into a Texas Star bone stock
sweet sixteen
(Well, almost stock. I replaced the voltage divider bias source with a

constant voltage supply and
then diode clamped it to prevent any type of current draw from modifying the bias source, as well
as enabling the amplifier to be volted and maintain bias).

Into a Barker and Williamson dummy load.

Using 3 70 amp Astron power supplies in parallel.

Swept the voltage control up and down.

As the voltage went up, the current draw indicated on the meters of all three amplifiers went up.

The drive source was on a seperate Tripp-lite power supply. This would keep the drive level
the same.

If you don't believe it, email Dennis Ostrowski. He will tell you the same thing.

As for your experiment, it was done in high school electronics class.

We don't generally use a fixed amount of DC output from our transmitters though... Sometimes a
squarewave, but as far as I know, this newsgroup is about a medium that conveys intelligence through
an AC signal, no?

Nice try.

Take the comments out of context, and you can twist them into whatever you
want.

Argue with people about a point, and they argue back saying your wrong.

Agree with people about something, and they STILL argue with people that
they are wrong.

This was talking about an inductor being used in the filtering network of
the output
of a transmitter.

Nice try.

Want another go?

> > Toll Free
>
> I've marked two statements in the above. Take a good look at them
> both. After consideration, do you think you might make up your mind?

I did when I wrote it.

You think you have the reading comprehension skills to figure out that the
original post was talking about inductors in two COMPLETELY different
circuits.. IE. One was an antenna, and the other was in a LC or Pi net
on the output of a transmitter.

> These two statements contradict each other. Care to explain your
> apparent confusion?

Done.

Or, are these chokes sentient, and able to make
> up their own minds about what they are supposed to be doing? Exactly

Charles,

I suggest you read the posts above it, and see that he took two different ideas, and compared them.

That would be like me comparing the power that is expended to run a bike, and the power expended to run a truck.

They both require energy, but ever since we left the Flintstones, we haven't been pushing them with our feet (unless we don't check the gas gauge and run out on the off-ramp :))

No, I wasn't buying into anything off any site.

He quoted a reputable manufacturer of antennas and posted what they said about the points of voltage maxima on an antenna, which was in agreement with what I said.

Or, do you really believe that voltage maxima is at the center of an antenna? (for a single band)

Depending on why one needs lumped inductance, it can easily be 300 different
things.
God help us if we ever get into how caps can be a coupling, a by-pass
device, and a power supply filter in the same circuit. And the pistons and
oil pans are the same because they are all cast aluminum??

>
> Again, I cited references, where NOBODY else did, showed tests made, and

> The CB got it's reputation from the movies.

I would think listening to CB would do far more harm to CB'ers
reputations than any movie could. What a cesspool of idiots, foul-
mouths, low-lifes, losers and drunkards. Ham radio at its worst
(say 75 meters or 3950) is pretty close to CB's average, in my
experience.

>
> Short of some glamour movie with hams tapping away to save the
> president; I doubt relaxed rules would cause a mass exodus to ham bands.

Exodus from where? If you mean from CB, as soon as the word's
out about repeaters and genuinely useful coverage areas
vs. CB's pathetic range, you'd better bet there would be a mass exodus
from CB to ham radio. You can only hope it would be the better half of the CB'ers
fleeing the bottom half. As it stands, written tests keep out *some* of the lazy
and stupid ones who might otherwise get in.

>
> It just won't happen.
>

Think again. Look at how many FRS radios have sold since they were
introduced just a short while ago.

>
> You have semi controlled access to you repeaters, you can police that
> can't you? The cost of gear is enough to keep most lowlifes from the cb
> away.

You try "enforcement" sometime. Local and state authorities are
(properly) not interested in matters like this which are
totally outside their jurisdiction anyways. The police (should) have way
more important problems than annoyed hams to cope with.

That leaves the feds, and basically this means the FCC.
The FCC takes literally years
to act against jammers and bootleggers, even when there are extensive
tapes and direction-finding evidence gathered by hams to catch the
miscreant. I know of one rare case
where a jammer in this area actually was convicted and did prison time,
but the case against him -- and his jamming -- went on for years. Last I've

heard he's out and back to old tricks.

It all started with a *borrowed* radio, with which he caused an unbelievable
amount
of trouble (even hampering firefighting efforts during the big Oakland hills fire
that claimed so many lives and homes). Another repeater jammer who also
liked to interfere with air traffic transmissions, got time, if I remember
correctly.
But for jamming repeaters -- you get away with it for years. :(

Besides, just because someone's a lowlife doesn't mean they don't have
money. Look at Shrub Jr. Besides, there's a lot of ham gear
stolen every year. Some of it surely ends up being used, and not
by licensed amateurs, either. Some people refer to "CB" as Criminal Band.
From listening on occasion with my HF receiver, it's criminal they don't
shut down the band and set up all arc welders to operate on those frequencies.

The only way ham radio is going to be able to cope with relaxed rules
is with a technological solution which can "lock out" certain users or
transmitters once they start to abuse the bands.

-- Ross

>
> The vast majority of those in the professional communications business
> are starting to view hams as spectrum hogs.

That's funny. I would think dedicated frequency assignments for
a local school or other very-low-traffic user would be at *least*
as wasteful, yet you see that all the time where trunking isn't used.

> and stupid ones who might otherwise get in.

UHF CB aka GMRS never turned into a cesspool. FRS has shot a short range
that interference between users is short lived. I agree that 27mhz is
garbage.

The bottom line is the spectrum is now worth big money. You can easly
lopp off 2/3rd's YES 2/3rd's of the ham spectrum and not greatly impact
the current users. The FCC knows the hams will comply if told to leave
so it would be a slammdunk.

Hams need to justify the holding of all that spectrum. Forget the code
b.s...they want your main resources...spectrum.

better get orginized folks cause the boogy man is coming and Rielly H.
won't be able to help you.

Yes. It is illegal. There is a presumed use law. It is just like
amplifier possession.
The "export" radios do not carry type acceptance. An amateur radio (HF
anyway) is not required to be type accepted, so you are ok with one in your
possession, unless it has been modified to operate in a service where
type-acceptance is required (CB) Presumed use again. There have been many
old-wives-tale interpretations, but these are essentially the facts. There
is no "burden of proof". It boils down to presumed use. You have it, and
they assume you have used it. The constitutional issues are a little
spooky, but noone reads that old thing anymore.

Probably gonna catch it here. Let me first say,
I DON"T CARE AT THIS POINT WHAT OTHER CBERS DO, LEGAL OR OTHERWISE.
I'M JUST ANSWERING THE QUESTION.

If it is a radio that was manufactured for EXPORT ONLY, then it cannot
legally be purchased in country. If it cannot legally be purchased, then
it cannot be legally posessed.

> If " Charlie" came to inspect my station, would I have to hide the radio or
> prove I only use it on the legal channels?

If it is not a legitimate, type accepted CB radio, you cannot operate it
on the CB band. At all.

Cool.

I was a cadet in CAWG about 25 - 28 years ago, was away from CAP for a couple of decades (active with other agencies), then came back in in AZWG in 1994. Currently in Utah, not active while I get things shuffled around, soon back with it.

I ain't Gunner but here goes my take on it:

You follow the instructions on the FCC website for filing a complaint.
Normally, the only way you're gonna get the cops involved in that one is
if you escalate it into a disturbance. They might try to talk to both of
you to keep it from going that far, but they'd have no way of knowing if
the guy was running high power or not, if he was legally licensed to run
high power or not, or if your equipment was faulty or not which is the
cause of the majority of interference problems.

better yet , leave the radio alone and get a amp .

the extra 5 watts , and extra modulation mean very little .

when you "juice up" a radio you lose audio quality , and can damage the radio ,
and shorten the life of the radio .

To me I think that a keydown is the same thing as those stupid ass hf contests where you use high power to make contacts.I have even seen hams using and running amps like henry and the alpha line of amps and seen them do 2500 watts or more on a bird meter.That is just as illegal as a cber running a linear cause you are only allowed 1500 not 2500. I would rather go to a keydown than a hf contest.well got to go 73's de kc8fwd......sk

Nobody is cross posting your posts, you are doing it yourself. It is obvious
you don't know how Usenet newsgroups work. Here I'll paste in the header and
you can see for yourself which newsgroups you are posting to. Notice the last
lines where it says Newsgroups followed by the groups you are posting to.

The BETA control is used for measuring a bipolar transistor's current gain.
The Gm control is for measuring a FET's conductance.
The LEAKAGE is about seeing what the leakage current is on a transistor
during a reverse bias condition.
I think you mean IDSS... this is a FET parameter that measures the current
from the drain to the source with the gate grounded.

What safety aspect. You're not really gonna go *there* are you?

Chainsaws, electric hair dryers, microwave ovens, golf clubs etc....

Look, there was a valid reason in the past for testing and code. The
hams were the kinda of the "rescue rangers" of the airwaves. Now there
are plenty of non hams on non ham frequencies that do what hams have
done. You don't need hams to make skywarn work. If you dropped some red
tape you might be suprised at the quality of volunteers you get to help
out with club projects.

jus about nobody builds a radio from scratch, most folks can grasp the
concepts of buttons and readouts and most will learn not to place their
tounges on the center antenna conductor while transmitting.

Cut red tape...
Get some new members fast...
Of start loosing spectrum.

You have to please "da man" or else...

Hi Jack,

I have a Very Nice Uniden SSB Base.

Here is a copy of the posting.
This is a stock Uniden Madison SSB Base rig, it has large external speaker with "Madison" on it and comes with a Turner Power Desk Mike. Unit has been packed away for the last 7 years. Perfect working order, some dirt on case top. $170 plus shipping.
Please Email
dekanblue@aol.com

Link to see this unit

AOR and Yupiteru filled the "niche" market when it became illegal to sell scanners that received cell phones.

They can't come in the country as scanners, or RX the cell band, but they sell them as Wide Band Rceivers.

Just an easy way to get around the laws placed on the books.

And where I said Power below, that should read price.

Forward totally depends on the amp being used. Currently I have nothing in it, as it is sitting waiting on the insurance adjuster.

With my 8 pill (the most common amp I run), I see about a thousand bird watts forward (I only drive it with a single 2290, since it is set up to drive the 32 or the 4CX5K) and see less than 5 watts reflected.

With the Messenger 16 pill, the same reflected, but forward power is about 2500 carrier.

At 5Kw PEP, it does around 5 watts reflected, PEP.

The Messenger is a LOT cleaner, since it still has bias on it, but has a completely reworked, regulated bias circuit that allows me the fun of running from stock voltage to 18 or so. I just never tried it any higher.

5343. Re: Why Hams Are Getting Even More Pissed

Newsgroup: rec.radio.cb
Date: 2000-09-13 00:00:00 UTC
From: sideband <sideband@cac.net.dontspamme>
Message-ID: <7690sskaki7hmha7j6698tejpiqreim6su@4ax.com>
Source record: 51826

The fact of the matter is this:

If CB'ers would stay out of the HAM's "areas" on the bands, and didn't bleed over into 10M, there wouldn't be a problem.

Yes, Freebanders would still be up between 27.405 and 27.999, but if they weren't causing interference, then what would cause the HAMs to look in the first place?

So, clean up your sets, get them transmitting on frequency, lose the overmodulation, and noone will have cause to search out where that interference is coming from... Get the picture?

Just my two cents.

-SSB

On or about 11 Sep 2000 00:00:22 GMT, x34956171135@aol.com (X34956171135), using the forum rec.radio.cb did say:

:10 meters is opening almost daily after months of low solar activity. And the
:number of CB/unlicensed interlopers is increasing, too. No,they are not
:spanish-speaking stations. These boys are from the Good old USA and they
:should know better.
:
:Heard on 28.435 USB Mhz today while west coast hams were attempting to work a
:Japanese station, a southern accented voice broke in:
:
: "How bout it ya got that that one one one here. Anybody
: got a copy on that one one one out there?"
:
:A ham asked this guy to please move and informed him that he was on an amateur
:band. His reply:
:
: "You say ya want me to move to nuther channel? Where
: you at? This is that one one one here"
:
:They took to ignoring him. But he went on transmitting, often over amateur
:transmissions, blocking out the Japanese station in the process.
:
: "CQ DX this is one one one here, one one one, one one
: one, anybody copy?....."

5344. Variable power on Washington (8719)

Newsgroup: rec.radio.cb
Date: 2000-09-13 00:00:00 UTC
From: __Xo__ <exodus_@goodnet.com>
Message-ID: <_YVv5.636$L46.383526@news.uswest.net>
Source record: 51827

I want to put a variable power knob on my washington.

I want to do this without removing the functionality of my rf gain knob. I was thinking about rerouting the phone jack to the back of the radio and using that hole for the new knob.

On this model it uses VR6 for AM power.

Is it possible to take out VR6 and reroute the reads to a pot?

Thanks!

"TW." wrote:
>
> $350!!!!!!!!!! Too much!

I agree. I have a totally pumped (negative peak compression
mod included) 2970 for $350 that's only a month old. It'll
do 150 peak watts and the clarifier is unlockd and centered.
I can send pics to anyone who's interested.

The guy who owned it reversed the DC polarity. On a 2970
doing that takes out the amplifier transistors, shorts the
"idiot" diode, and makes the input filter cap explode.
When the owner learned of the repair fee, he decided to
trade the radio to me for my restored President Jackson.
Since then I have repaired and fully modified the 2970
and am offering it for sale.

Bassman wrote: Man, I have never heard of a Mongoose either. I just found the picture for the dude.

I haul freight for a living. We all run Northstars, Galaxys and an occasional "old" Cobra. With the exception of the new Rangers, there is no other worth considering. I just don't know how the new technology of the Rangers would hold up to the beating we give a radio. We slipseat and a radio leads a hard life.

It is a very important tool in our trade. We use them to make our living and without them the road would be a much more dangerous place than it is already. "Citizens Band" radio contributes a lot to todays society wheither you realize it or not. Ham's are not exclusive to this even though they serve an important function as well. As radio lovers we should come together and try to understand each others wants and needs. Just a thought,

Tennessee Bassman

Sorry doc but I have to disagree Its no law saying you cant have the radio just to listen. But if you start tranmitting then you are breaking the law. I know the ham rigs from rat shack are not export but is says in the adds that you cant transmit without a tickit but they will sell you the rig, the last time I checked. I would also like to add that most people if they have the ability to transmit then they probably will sooner or later. So far I never transmitted off of 11 meters with my galaxy but cant say that I never will just to try it out in the future. Then I will be breaking the law. But so far I have not had much temptation. But before you say it I am still breaking the law by 6 watts. But I feel that not going to hurt anybody compared to all those megawatt stations out there No flame intended

Take care.

(This is not directed at Bassman, but at the selfrighteous ham guy quoted
above)

Another brilliant idea from ham guy. Throw gasoline on the fire by having hams
showing up here " Determined to make life miserable for the slippery, slimy
weasels" here on the CB ng. This will mean the weasels will have to go to the
ham ng group and make life even more miserable in response. I pick the weasels
as a slam dunk favorite to be way more annoying to the hams than the hams can
be to the weasels.

Old chinese proverb "choose your enemies carefully."

Hello Cletus: Thats Don our new token ham radio goof ball, save the whales, follow the rules, be a geek, I'll tell the teacher, ect.

We usually get three type of ham guys here on rec.radio.cb

1- Whinny, complacent, know it all, unfriendly, snotty, I'll show you guys, goof ball, lives with Mother still, Like Don here.

2- Selling a linear amplifier.

3- Friendly and helpful.

Don is in the 1st stage now, but may soon drop off into stage number 2 as soon as Mom throws him out. He will be friendly then.

Jay in the Mojave

>
Jerry, I was suggesting that the hams simply run a bunch of qsos on top
of the 'illegal' station. An amateur CANNOT, even to politely ask him
to move, contact any station not in the amateur service (with some
limited exceptions). My suggestion was that since the amateur station
would be protected from an unlicensed transmitter (such as the wireless
networking devices and anti-theft devices), the unlicensed facility
must accept any interference from a properly licensed and operating
station. Of course, we do not intentionally interfere with anyone.
You simply have a bunch of qsos which happen to fall within a 2KHz
spread of the offending carrier frequency on 10 meters. Whether a
digital mode or cw would depend upon the operating frequency. Not a
pleasant thought, to be sure, but I don't know of any other options
since you can't talk to the offender legally (and that might be most

anti-productive as well, just as answering Hotrod, cool, tron, etc on many boards has been). One possible answer (and legal) is to have the ARRL start some big contests with awards dedicated entirely to 10 meter activity. Make it digital down lower and CW in the phone band.

I'm sorry. You are wrong. Your explanation does not explain how I
walked into the FCC field office and demanded to get back my legally
possessed "export radio" that was modified. They complied with my
demand because they knew that I knew the rules concerning this.

Copied below is what the FCC goes by.

PUBLIC NOTICE
FEDERAL COMMUNICATIONS COMMISSION
1919 M STREET NW
WASHINGTON, D.C. 20554

May 13, 1996

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the
Commission's rules regarding equipment that is intended to operate in
various radio services in the high frequency radio spectrum, including
"10 meter" Amateur Radio Service (ARS) equipment

The Commission has noted that a number of transceivers
imported as ARS equipment are also capable of transmitting and are
being operated in nearby frequency bands allocated to other radio
services such as the Private Land Mobile Radio Services,Maritime
Services, Auxiliary Broadcast Services, International Broadcasting
Services, the Citizens Band Radio Service, and the U.S. Government.
Operation of this equipment causes interference to the authorized
users of these frequencies. Some of these transceivers are capable of
using output powers or emission types which are not permitted for the
radio services listed above and some are capable of transmitting in
the radio astronomy band where no two-way radiocommunication is
permitted. Some manufacturers are promoting the sale of conversion
kits, or have designed their transceivers such that they can easily be

modified by the users, to extend the operating frequency range into the frequency bands listed above. In addition, so called "export' radios which are deliberately designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to: (1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a gn=rant of equipment authorization for the radio servce(s) in which the transmitter is capable of operating; (2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued: or, (3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission issued station license. Violation of the Commission's regulations will subject manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment In addition, the equipment described above can be seized by, and forfeited to, the government

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road. Columbia. Md. 21O46, (301) 725-1585, extension 223, or E-maiI: ghendric@fcc.gov.

Sounds like it's illegal to sell, buy, own, or use one of these radios to
me.
If it can't be legally sold, then it can't be legally bought. If you
can't legally buy it, then you surly can't legally own it.
Others may see this differently. That's fine with me.

The license requirement is not 'red tape," John. The exam you take to get that license is designed to insure that you have the basic knowledge to operate a radio safely and that you know the rules concerning that radio operation. The license is proof that you have taken that exam.

This differs from CB because the ham radio service differs from CB. Unlike CB, the ham radio service involves the possibility of very high powered radio equipment, a wider range of technologies (repeaters, satellite, digital modes, microwaves, etc.), a wider range of frequencies and frequency conditions, and a stated mandate of providing emergency communications in time of need.

It is also for these very reasons that rule enforcement is much stronger in the ham radio service.

I see what you are trying to say but the logic does not make sense. If you want to do it legal their is a lot of red tape. If I wanted to I could go out and get me a ham rig tomarrow without even having a permit and talk away. So what good is all that red tape that you say is keeping morons off the air. CB has strict rules and requirements too. It not the red tape that gong to keep the morons off. Its enforcement of the rules. Plus you do not need a permit to own a ham rig. just one to transmit. All the red tape is doing is keeping the good law abideing people off. If morons want to talk on ham they will with or without a permit.

Didn't the navy use spotlights for ship to ship communications?
A handle on the side of the spotlight would be used to open
or block the light, and it would be controlled with something
like or maybe it was Morse code. Good for keeping the enemy
from receiving the comm on the radio, you aim the narrow beam
at the ship you want to talk with, and presumidly others off axis
the beam would see nothing.

No.... the recent FCC restructuring of Amateur rules eliminated the old Novice Class license as the 'beginner's' ticket. (Old Novices retain their privileges, but no new Novice licenses will be granted... same with the Advanced class license)

The new classes are Tech, General, & Extra... each with their own written exam. (Techs can opt to be 'Code' or No-Code') General and Extra Class licensees are required to pass a 5wpm CW exam (no longer multiple choice... now, 'fill in the blank')

'Fraid so... Export radios are not 'type accepted'(approved) by the
FCC. So using one is illegal. I don't think possesion is enough to
worry about, they do have to have reason to believe your using the
radio,
that's the 'probable cause' for legal procedings. No 'probable
cause',
no case...

Nice style. Obfuscate the issue (smoke and mirrors) by asking a
question that wasn't material to what was being discussed. Just
admit that your wrong. Your reference to the 'reputable' antenna
manufacturors is rediculous! I'm sure I'm going to believe them
after looking at their 'gain' figures.

'Tis true, but that does nothing to get you AM or FM, which is what (AM
at least) the majority of CB operators use.

If you are a strict SSB operator AND you can find an HTX-100 really
cheap, then, I'd agree that it might be a satisfying radio. Otherwise,
there are other exports and 10 meter radios for sale on the used market
that can be had for similar prices and not require all the work to use

on all the modes.

That's an excellent point John. But they may soon find that no one is
talking
back. In most cases the "moron" will only keep transmitting if he/she is
getting responses. (kind of like a troll on a newsgroup). A (good) ham op
is taught early on to ignore these transmissions. It's just no fun for the
illegal
operators if they don't get someone to bite.
And if the illegal op really just wants to make contacts, once again, no
one
is likely to respond to someone without a valid call sign.

I don't know exactly what code is/was used but obviously lights
would be capable of sending dits and dahs. I can imagine someone
using a flashlight at night to call for help using Morse code.
If I remember right, it happened fairly recently.

My point is that a method, like tapping or mirrors, that has no
natural way of sending both short and long sounds or pulses, is
virtually useless during emergency attempts to communicate with
hams who generally know only radio Morse and not telegraph Morse.

Say Jack,

You might want to contact "Jay in the Mohave" for a MASTADON5000 (newly refined 5/8wave ground plane). I'll be picking one up from him here shortly. It has the capabilty of going into 10 meter ARS if you wish (judging by your Ham Call).

From his research and from seeing his antenna farm, I believe that Jay has spent alot of time researching and refining the Avanti SigmaIV/Penetrator500 5/8 wave antennas. With his new Mastadon 5000, bandwidth is alot wider and efficient.

Otherwise, a Maco V5/8 wave ground plane will suit you just fine.

A blonde walks into a bank in New York City and asks for the loan officer.
She says she's going to Europe on business for two weeks and needs to borrow
$5,000.

The bank officer says the bank will need some kind of security for the loan,
so the blonde hands over the keys to a new Rolls Royce. The car is parked on
the street in front of the bank, she has the title and everything checks out.The bank agrees to accept the car as collateral for the loan.

The bank's president and its officers all enjoy a good laugh at the blonde
for using a $250,000 Rolls as collateral against a $5,000 loan. An employee
of the bank then proceeds to drive the Rolls into the bank's underground garage and parks it there.

Two weeks later, the blonde returns, repays the $5,000 and the interest,
which comes to $15.41.
The loan officer says, "Miss, we are very happy to have had your business,
and this transaction has worked out very nicely, but we are a little puzzled. While you were away, we checked you out and found that you are a multimillionaire. What puzzles us is, why would you bother to borrow
$5,000?"

The blond replies....."where else in New York City can I park my car for two weeks for only $15.41 and expect it to be there when I return?"
Finally, a smart blonde.

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

5417. Test Equipment Question...

Newsgroup: rec.radio.cb

From: FeMaster <FeMaster@hotmail.com_spam>
Message-ID: <srv81fjfct6146@corp.supernews.com>
Source record: 51909

I have acquired three devices for what I am assuming to be some form of radio testing or likewise. If anybody can provide any information on the units (age, use, value, etc.), or point me to a site with info I would greatly appreciate it.

Items:

Conar Model 281 - Signal Generator
Conar Model 212 - Volt/Ohm Meter
Conar Model 214 - Transistor Tester

Generally I know what they are, but they have a few things that I have not seems before. Each unit is built into a steel case. Possibly they are home-build units, as the soldering inside resembles that of something that was assembled by hand.

I have never seem a real transistor checker (only the $20 cheapy that Radio Shack sells), so this unit has some things on it that I have no idea about. For instance, a BETA CAL knob, a Gm ZERO knob, and positions for checking LEAKAGE and 1 (superscript) DSS. If anybody can provide any info on these features, please feel free to send away...

I will add some pics to my website and provide links to them in another post.

Thanks for any help or info!

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 45.00 (US$) INCLUDING shipping from Canada
Great deal ! ! !!
A Picture can be e-mailed.

Mark, with the exception of chain saws, all of these devices are designed so the average, unskilled, consumer can operate them safely without harm to himself or others. This is not so with high powered radio equipment, especially in the microwave frequencies.

More importantly, ham radio, under normal operating conditions, involves the risk of harming others (unlike the devices mentioned above, including the chainsaw). Radio signals don't just stop at your front door - you're neighbors are involved also. So are the children who happen across your antenna in the back yard. That is why ham operators are tested for knowledge about RF safety.

5430. 1/4 vs 1/2 vs 5/8 Wave - Theoretical Question

Newsgroup: rec.radio.cb
Date: 2000-09-14 00:00:00 UTC
From: Cowboy <cowboy_krs21208@my-deja.com>
Message-ID: <8pqdf9dbp1@nnrp1.deja.com>
Source record: 51943

What is the formula that identifies the length of an antenna as a particular wave?

If 1/4 wave is 102"(or is that 104"?), then how does a 1/2 wave come out at 18'(or 216") and a 5/8 wave at 24'(or 288")? If a 1/4 wave measured at 102" or 104", why wouldn't the 1/2 and 5/8 wave antennas be multiples of 51" or 52" (1/8 wave)?

For extra bonus points :^) - can someone explain to me the relationship of the wave length and its importance to signal efficiency?

Eagles and Titans and Diamonds are wonderful old classic 5W CB radios,they are a blast to have, but are OLD, service/parts are almost a specialty item now, and any way you look at it are not a value in the $500 market unless you collect. There are a LOT of real live solid state 100W HF ham rigs that will run 11M AM/SSB and aren't that hard to run,and can be had from 300 on up, and also some 10/11M RCI clone bases,as well as Galaxy rigs if you are leery of learning to run a true HF rig. Get bigger power and modern technology for less $!!!!

I disagree. If you had met some of the hams and radio jox I've known
over the years, you would know that VERY-high-powered radio equipment
can be operated by utter idiots.

Personally I still prefer the Starduster Base Antenna. Recently I
came across a few, new in the package, Starduster/Skylab antennas and
sold them all but one. If anyone is interested in it, e-mail me.

first off a 1/4 wave in cb frequencies is actually 108" from here you
should be able to figure out the rest.

Hey, I didn't say the system was perfect, Keith. Of course there are idiots who make their way into ham radio. We can only be thankful that they're not trying to trim coax with a chainsaw. But, overall, the system works, and that is probably about the best we can hope for it. And even a system that is only partly successful is better than no system at all (which is what some are advocating in the thread).

The formulas used to calculate wavelength are:

1/4 wave: 234 / Freq (in MHz) = Length (in feet)
1/2 wave: 468 / Freq (in MHz) = Length (in feet)
full wave: 936 / Freq (in MHz) = Length (in feet)

>If 1/4 wave is 102"(or is that 104"?), then how does a 1/2 wave come
>out at 18'(or 216") and a 5/8 wave at 24'(or 288")? If a 1/4 wave
>measured at 102" or 104", why wouldn't the 1/2 and 5/8 wave antennas be
>multiples of 51" or 52" (1/8 wave)?

1/4 wavelength on 27 MHz is about 108", not 102". The typical 1/4 wave
steel or fiberglas CB whip is 102" long because they are intended to be
used with a spring at the base, and the springs intended to be used with
those whips are 6" tall (giving you a total length of 108").

>For extra bonus points :^) - can someone explain to me the relationship
>of the wave length and its importance to signal efficiency?

Pick up a copy of the ARRL Antenna Book for a complete explanation of
antenna theory. It's one of the best sources of information on this
topic. You'll learn a lot by reading it, and it will dispell plenty
of rumours, urban legends, and out-and-out lies about antennas. You
would be surprised at some of the bullshit that CBers tend to believe
about antennas. It's not because CBers are stupid, but because there
is so much false information that's passed around the CB community.
Most CBers are not electrical engineers, so they believe the crap they
hear. I know I did too, before I got my ham ticket (and my degree in
EE) back in the mid 1970s. What a culture shock!

100 watts of rf power does not create a major safety concern,heck I can
burn myself with a 100 watt lightbulb and suffer a greater burn. safety
is also not going to convince the fcc or congress...ranks do the
convincing.

> More importantly, ham radio, under normal operating conditions,

If you have problems with kids around feed lines and antennas then they
should be raised and secured. If you are so close to the nieghbors that
stray rf becomes a safety issue the station in question has a big
problem.

I will have to throw in with the others. I have a S23/R27 pair, A GE MKIII with AM only transmit, a GE MKIII AM/SSB Transmit, 2 Tram D201s, 2 ARF-2001, DAK Mark IX, and probably at least 20 tube-based rigs from that era Cobra, Lafayette, Teaberry, Robyn, Kris, Regency, Johnson, Shakespeare, Courier, Pacer, etc..). They look nice on the shelf, and it is nice to pull one down and talk on it for a few days. These rigs should not be relied upon as the primary rig. Once you get a setup that serves your needs, then is the time for considering owning a classic.

The FCC has just approved a new license free 2 watt CB service in the VHF band. This is slated to go into effect in October. There will be 6 channels -
151.82 , 151.88 , 151.94 , 154.57 , and 154.600. Some of these freqs were formerly licensed commercial "dot" channels. A new "Subpart J" has been added to the Part 95 Citezen's Band rules and regs to cover these new FM channels. Following the "FRS" example, they have decided to name the band "MURS" (Multiple user radio service) Unlike FRS, detachable & external base & mobile gain antennas will be allowed, & power is much higher at 2W vs 1/2 watt. Actual base & mobile radios will surley be made also. CTCSS, DCS and other coded squelch systems will be included in many of these radios. Repeaters will not be allowed. Stay Tuned.....

My Galaxy Saturn had the same thing. Real handy along with the built-in freq counter; could get in between the channels and have everyone looking for us on. When I was working security in college, I kept a 12-volt lawn-tractor battery, battery charger, and 102" whip with a quick-release mount in my guardshack (it had a metal roof...perfect for the whip) and would bring my Galaxy and little Palomar 300 toaster in a backpack. We had a very active CB community in those days, incluiding my mom who was disabled but had a big ol' base station and sat up all night running her mouth and my bro-in-law who also worked security. Beat the hell out of sitting out on post all night staring at the wall clock. Did this for a couple of years until my mom died, my bro-in-law left my sister, and then I just lost interest in CB. I'd had my ham ticket for a couple of years by then, but had stayed on 11m because of all the friends I had there.

I know what a VFO is and what it does. Had one in an old Golden Eagle (Listen to the scream! LOL). I was just clarifying (pardon the bad pun) what was an was not legal according to the FCC.

Cowboy, you are in one of those areas that cause lots of hollering and not a lot of communication but I'll give it a try.

The basic difference among 1/4, 1/2, 5/8, and 3/4 once you get them matched is how the magnetic field arranges itself around the antenna and the direction of maximum radiation. The idea is that a low angle above the horizon is better for long-haul work. As an antenna gets longer, up to a point, the radiation angle decreases and it happens that 5/8 is the lowest of the batch. It requires a loading coil to bring it to resonance but then you can tap the coil and get a 50 ohm match so no big deal so it is said. In practice, the 5/8 has a few vices no one talks too loudly about. On CB freqs, this is a bit academic because you are not likely to put a 25 foot whip on your car.

I have a feeling you have been hanging around the VHF/UHF antenna section of your supermarket. When a quarter wave is 18 inches (VHF), or six inches (UHF), or 3 inches (cell phone and 800 MHz trunked repeaters) some incredible arrays are possible. One fairly standard one is a 5/8 above a 1/4 wave in what is called a collinear (along the same line) array. On 11 meters this beast would be something like 40 feet but on VHF it would look like a CB whip with a funny section in it, on UHF it would be about 26 inches, and it is the standard thru-the-glass cell array at about a foot.

The short answers to your questions (I think) are:

1. Frequency and wavelength are related. Minor matter called the speed-of-light.
2. Antennas are designed for a purpose, not in an ivory tower.

Any of this make any sense???

If you really get curious, the ARRL Antenna Book as Dean mentioned is a worthy investment.

Dick

I would suggest that you read up on microwave energy at 100 watts that is
feed into an antenna.

From: fire228@my-deja.com
Message-ID: <8pr12g$6gb$1@nnrp1.deja.com>
Source record: 51984

******

All figures are for a design frequency of 27.2 mhz.

1/4 wave = 9.044117647058823529411764705882352941176470588235 feet

1/2 wave = 18.088235294117647058823529411764705882352941176470588235 feet

5/8 wave = 22.610294117647058823529411764705882352941176470588235 feet

(figures above derived using formula #3)

1# 468/fmhz for 1/2 wave, end supported

2# 478/fmhz for 1/2 wave, center supported

3# 492/fmhz for 1/2 wave, no end effect/free space

When the ground wave field strength of vertical
antennas is examined, we find that IF a 1/4 wave
antenna has 100 mv. field strength at 1 mile, a half
wave vertical will produce 125 mv. and a 5/8 wave
will produce about 140 mv., again, all over a
distance of one mile.

first thing try more than one meter , you meter may be broke

if its swinging backwords , have the amp looked at buy a tech .

if the amp is ok , your driving it to hard , over modulation will cause back swing .

try "small radio " see how it swings .

if none of these work , sell it all and get all new stuff

5476. Re: 1/4 vs 1/2 vs 5/8 Wave - Theoretical Question

Newsgroup: rec.radio.cb
Date: 2000-09-14 00:00:00 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <39C11071.1E0B@bellsouth.net>
Source record: 51989

Cowboy,

I'll give it a shot. The formula for wavelength in free space is 984/ freq. MHZ. And, of course, 1/2 of that is 492/freq. MHZ. BUT, the actual length of a 1/2 WL antenna will not be exactly equal to the half-wave length. There are a couple of reasons for this. Conductor size in relation to the wavelength, for example, and "end effect, which occurs with wire antennas supported by insulators at the ends. The insulators add capacitance to the ends which contributes to a shortening affect. To get a better formula which accounts for this shortening--and even it isn't 100% accurate---a percentile of 0.95 is factored in. This gives you a divisor of 468 for a half wave wire, or dipole if it is fed in the center. Thus, a full wave wire @ 27 MHZ would be about 36 feet plus or minus. One half wave wire would be just a tad less than 18 feet. One quarter would be around 9 feet. The reason 102" whips are cut that way is to allow for the spring the mfrs figure customers will want at the base.

Another thing that one has to figure in is the place where the wire will be installed. Antennas are affected by their surroundings such as buildings, metal structures like water tanks, silos, and radio towers, also by the integrity of the ground over which it is placed, and, finally, by its height above ground. So when you use the 468 formula (492 X 0.95=468), it likely will not come out "exactly" correct. You will still have to prune the antenna, or add to it, to achieve resonance at your favorite frequency.

I haven't tried to get really technical with this, but I hope I have helped you. I see lots of ops trying to use the 492 figure, but it is less accurate due to the factors I mentioned. Have fun!

<< Hey, perhaps you should learn to read, cockroach.
>>

Get real, Paul. The original poster wanted to find out how to get his RCI to go from 24 MHz to 32 MHz. The "receive only" gag is just a ploy. He is surely going to use his RCI to transmit. Do you think we are all so stupid?

<>

Talkington, probably the reason you don't use ham radio is that you ain't got but a no-code tech license.

The 10 metere ham band is filled with outlaw CBers today. So why SHOULDN'T hams come to the rec.radio.cb newsgroup and complain? After all, this is the place that outlaws get amps and modded radios.

It would, if your looking for an isotropic antenna in free space. For practical purposes, your figures are about 2-5% too long. Stick with the 234, 468, 615, 984 figures, you'll much closer to the correct lengths.

There are actually two different 2950DX models, if you purchased it from an amatuer radio outlet, it may very well be one of the DX1 which is intentionall made so it can not be converted. The CPU is not the same as the the DX2, which can be converted, and is often sold through different companies. Ranger USA sells the right radio to the right distributor to keep everybody happy. Unfortunately a lot of customers didn't know they were buying a radio that couldn't possibly be converted. >>

Doesn't it bother you that A LARGE NUMBER of the radios you sell are being used by unlicensed people on the 10 meter ham band?

> I see what you are trying to say but the logic does not make sense.

It matters not if there is a logical defense, the
bottom line is that the reality of history has
shown that it (testing) is valid and works.

> If you want to do it legal their is a lot of red tape.

If passing a relatively simple test is "a lot
of red tape" then I wonder what it is you
really want. Indeed, my presumption of your
several postings over the last few days seems
to indicate (IMHO) that you want a NO test
license or perhaps even a no test/no license
amateur radio service.

> If I wanted to I could go
> out and get me a ham rig tomarrow without even having a permit and talk
> away.

You could try that, but you'd be caught at it.
Hams do not support such "pirate" operators.
Could you get away with it for some time? I guess so,
but you'd be a rogue operator and never accepted
by licensed hams and, more likly, pursued (
justifiably so) as a law breaker.

> So what good is all that red tape that you say is keeping morons off
> the air.

Let me make this perfectly clear. The "red
tape" you complain of (as minimal as such red
tape is) does work. It ain't perfect, but
just compare the CB land free for all frequencies
to ham bands and you can come to no other conclusion.

> CB has strict rules and requirements too.

Of which the FCC does nothing except in the
most severe cases. The FCC has abondoned CB
as far as rules enforcement (IMHO).

> It not the red tape that
> gong to keep the morons off.

Again, history proves you wrong on that point.

> Its enforcement of the rules.

Enforcement is absolutely needed to go
after the real offenders. Ham radio had
some real bad apples until a year or so
ago...BUT they were easy to identify BECAUSE
they were licenesed. The FCC began cracking
down and the worst are gone and many other
border-line cases have cleaned up their acts.
On CB, the FCC doesn't even know the name
and addresses of those that operate legally,
much less those that operate above the law.

> Plus you do not
> need a permit to own a ham rig. just one to transmit.

True. Your point to that is what?

> All the red tape is
> doing is keeping the good law abideing people off.

So how come there are over 1/2 million hams
of all sorts of backgrounds that managed to
get by the "red tape". Truly you can't
suggest that a single test (to get a technician
amateur license) is too much red tape for you?
But then, maybe you do and, if so, that is truly
a sad commentary on your personal commitments.

> If morons want to talk on
> ham they will with or without a permit.

They certainly can, and they will also then
face heavy fines and/or jail time. I'll happily
join in the pursuit of anyone that does so.

No cheers,
Bill K2UNK

> their are a lot of hot heads out their that would give them what they want.

Again, I point to history of ham radio which
has a track record of total opposition to
"pirate" hams on the ham bands. There has
been no such sub-element of "hot heads"
out their that would give them (pirate hams)
the time of day. More likly, the vast majority
would help "nail" the moron/pirate ham.

Cheers,

> doing is keeping the good law abideing people off.

How is that? First of all it isn't "red tape", it is the requirements to obtain a license, which anyone with a little initiative can easily do. The amateur service allows those who are licensed to build and modify their own equipment if they choose to do so, however it isn't required (name some other radio services that allow this). Because of this the testing is to establish that the person requesting a license to operate in the amateur radio service has at least a basic understanding of theory and knowledge of the regulations so that if they do choose to construct a transmitter, they will hopefully have the knowledge to unsure that it will meet certain standards and not interfere with other services. Why do you think that radios used in the CB service must be type certified to meet certain FCC required stability, emission, and power output standards and no modification is legally allowed? It is because there is no "red tape" (requirements) to operate in the CB band thus anyone without the slightest knowledge of radio theory can operate there. Unfortunately adhering to those standards doesn't happen that way in CB and that is why the CB band is the sewer pit of radio communications and the FCC gave up on any enforcement except for special cases involving severe interference to other services. All one has to do to get on CB is run down to K-Mart, purchase a CB, hook it to an antenna and start shouting "aaaaaaauuuuuuuddddddiiiiiiooooo!!!" If passing some simple requirements is just to hard or those requirements are just not worth the effort to you to have access to the ham bands, then the CB band should work out just fine for you, but don't whine and cry and expect the privilege to operate in the amateur bands to be given to you without some effort on your part., just as many things in life come only after putting forth some effort.

>
>For extra bonus points :^) - can someone explain to me the relationship
>of the wave length and its importance to signal efficiency?

theres a matching coil in a 1/2 and 5/8ths that adapt everything all
up,the closer you are to the full wave of the signal,the more your
receiver can grab ok...if u have a 1/4 wav,then ur only gonna get
getting about 1/4 the ss,theoretically speaking.For some odd reason a
1/2 wave antenna seems to work the best,and when they make 5/8th wav
antennas they are going just beyond and getting just a tad more better
signal,if they go any further towards a full wav,then it may not work
well,after all a vertical would not stand up very well,unless u have
strong metal,I have experimented with full wav dipoles for any
peticular band,and the swr never seems to wanna be 1:1 ok..so that is
basically the reasons,they can be spoken off in a lot more detail of
course...73

> Doesn't it bother you that A LARGE NUMBER of the radios you sell are being used
> by unlicensed people on the 10 meter ham band?
>

once again you are talking out your ass. Have you done research on Express Electronics customers to find out what they use products bought from them for? I doubt it.

I would be willing to guess very few of the customers they have use 10 meter. Out of the thousands of export/modded radios out there there are WAY fewer people that talk on 10meters. I would have to suspect that the vast majority of owners with an export/modded radio stay away from 10 meters.

Everyday I listen to my radio that skip is high on the cb band I scan the "freeband" freqs and also go up to 10 meters to see what's out there. I here tons of people on the 27.415-27.995mhz region than I do 10 meters period. so if there is that little traffic on 10 meters altogether then how can "SOOOOOO MANY" people be invading 10 meters?

I really don't think you'll respond to this message. You never respond to my messages so I won't hold my breath for an answer to this but WHY have you chosen this battle. You have little to no support for your cause in this forum. Perhaps you should try a different venue to vent your anger. You aren't changing anyones mind that already has illegal radios and you aren't going to stop the majority of the people asking how/where to get or modify the radios they ask about.

You aren't making anyone's life miserable here. It is even easier to stop hearing what you have to say in these newsgroups than it would be if you were ranting away on the radio. If you were on the radio we would have to either turn the radio off, change freqs, or overpower you. Here all we have to do is turn on the filter to not even show your post. So the only people looking at the dribble you write are those of us amused by you.

now go play with your ham friends.

You have hams usuing 100 watt microwave radios?

Do tell, cuase i'm willing to call myself stupid. The max the units I
use in 2ghz are limited to 10 watts. But if you say hams are allowed to
blast 100 watts on a microwave frequency I guess I would have to agree
that there is a safety issue.

So what do you get to do with 100 watts on a microwave freq..
I bet it's great for those short intercity hops :0.

You are laughing at yourself. It really is sad you have no other, more important things to do. Most of the folks in here could care less about you or your opinions. I find it interesting that you would seek to enforce your opinions on the cb'r population that resides in this newsgroup. I would hazard a guess and say that the majority of us do not play around out of band, but it would be a guess and I, unlike you, do not make a blanket statement about a population that I (and you), personally, know nothing about. Casting aspersions and making wild, unfounded accusations about a population, just because you "heard" what you assume to be a couple of cb'rs talking out of band is truly ignorant. I've spent enough time with you today.
Begone.

Hello Cowboy & Doc:

Thanks for the e-mail reply Doc!

Cowboy:
The subject on the vertical antennas you requested is not all that easy to answer. I am going to interpret the question as for elevated Vertical Ground Plane Antennas. Because 1/2 & 5/8 wavelength antennas just won't go on a car or truck being to long, ah!

This is the formula I use, which when divided by the frequency in MHz, will give the antennas wavelength in inches.
11212.85 divided by the frequency in MHz, Example:

11212.85 divided by 27.210 MHz = 412.23 inches

Then you can multiply this result by .25 for 1/4 WL, .5 for 1/2 WL, .625 for 5/8 WL, ect.

This figure is 5% less than the 11803, that is usually used to figure a antenna wavelength in inches. This 5% allows for velocity factor that slow down the energy in the antenna. Anyway its pretty dead nuts on for Vertical Ground Plane Antennas.

However, the differences in a few percentages won't be a big deal in the way the antenna squirts out its energy, or how the antenna radiates its energy into a pattern. Is not big deal G.I.

The differences between the 1/4, 1/2, and 5/8 wavelength antennas signal efficiency is a mixed bag. The answer must be explained, and shown in antenna pattern of the different wavelength antennas. Also the installation of these Ground Plane Antennas can change the way they work, "BIG TIME"!

There is a lot of reference material out there that shows the different wavelength antennas as having very different angle the antenna transmits or receives the energy in a tear drop type pattern. All this material is based on having a perfect ground plane surface, which none of the elevated or vehicle body mounted vertical antennas is mounted too, in the real world.

The Antenna Modling program Eznec shows a very different antenna pattern coming from the Elevated Ground Plane Antennas, as compared to the reference material, that is based on a perfect infinite ground plane.

>>For extra bonus points :^) - can someone explain to me the relationship of the wave length and its importance to signal efficiency?<<

Ok for extra bonus points here goes.

The different antenna gains would prove nothing here. Because there are so close to each other, and the different antenna installations can make a 1/4 WL antenna work better that a 5/8 WL antenna, in some cases.

The shorter antennas have a higher angle of radiation, which in some cases will have a stronger signal on short skip stations that arrive at the antenna, at this higher angle of radiation, that make a 1/4 WL or 1/2 WL antenna work better that a 5/8 WL antenna for short skip. But the 5/8 WL antenna will work slightly better than the shorter antennas for long haul skip and local stations.

But the over all higher performance will come with the longer antenna, the 5/8 wavelength antenna. Not from the higher gain, but from having a lower angle of radiation, or take off angle. In a nut shell.

Ok here's the poop that isn't in a lot of books and such:
The impedance matching circuit for these antennas has a certain amount of loss. If a antenna has several dB of insertion loss in its impedance matching circuit or system, then any gain that is had in the antenna is going to be down due to the loss in the impedance matching circuit.

I use Black Al Capone, Dr. Crow, and a Triple Deuce single coil.

All of them match about the same.

The burban was in a wreck :(Hope to get it fixed when I get back from
vacation in San Diego next week.

I actually have two boxes... And move the tube from box to box.

One is connected as a triode (grid and screen together). I run it straight class B. Zero bias.

The other one is connected with both screen and grid bias.

I run the filament, screen and grid bias transformers off an intverter, therefore I can pull the amp out, bring it in the house, and only have to plug it into 110, and connect the HV power supply. Also maintains extreme linearity when I want to run the Class AB box... Since the fil voltage, bias and screen are all somewhat stabilized and psuedo-regulated.

The alternators (3) are all run with contactors, so they can either feed my transformers (3) or I can cut the transformers off, and run into a external diode bridge. This allows me to run either AC or DC, with the flip of a switch.

I typically see about 15 KW PEP out of the amp being driven by just the TS Modulator (run it at about 17 volts), with screen voltage.

When I put the tube in the Class B box, I can get about 20 thousand carrier, but it still backs up to about 15. PEP values are a bit higher, though, and I have to hit the TS Sweet Sixteen with 18 volts, which gives me a couple grand drive.

This is not a binary posting newsgroup.

Don't be cheap.

Spend 10 dollars and get the original manual from Wilson, Mayco or AS.

Then, you get to see how they put it together, and can study it and if you have problems, have something to measure against.

> Actually, any amplifier designed for AM or SSB is a LINEAR amplifier
> and CANNOT be a true class C amp.

Wrong.

People use Class C amps on CB all the time.

Listen to one of the DaveMade, Cookie, Pirate, Storm, etc. on SSB and
you will find that to be true.

It must be a class a, ab, or b. I
> have seen posts stating that the zero bias amp, since you need 3/4 to 1
> volt before anything comes out must copy less than 180 degrees of the
> sine wave.

Yep. Compounded in push pull amps, too.

Well, maybe 179.999 degrees. A class B amp conducts (in
> theory) for exactly 180 degrees. Who is measuring? I doubt you'll
> ever get an amp to conduct for EXACTLY 180 degrees, if for no other
> reason than quantum mechanics probably forbids it.

OK, your right, your math doesn't make it work, but lessee here...

A transistorized, grounded base amplifier takes about 4v PtoP (thats
Peak to Peak) to saturate.

4 volts.

You have two transistors that conduct on opposite ends of the drive cycle.

This means, that the crossover point will be extended to approximately 1.4
volts
(This is assuming you have two transistors who turn on at .7 volts...)

Therefore, your amp is conducting for 2.6 volts of the 4 volts of drive.

Now, you also have to figure in that most people overdrive their equipment
with
overmodulated, I am turned off for 50 percent of the time carrier drive
signals.

Then, figure in the "great" sound of crossover distortion.

A class C amp
> usually conducts for LESS than 90 degrees of the electrical cycle.

That is an arbitrary number, and you have to take in the linearity of
the exciter.

The
> big problem is overmodulation. People say you cannot overdrive an SSB
> signal. Well, you can flat-top. This is to say you drive the amp into
> saturation. On a single tone, this means as you increase the drive,
> what comes out approaches a SQUARE wave. Oh, the RF itself will remain
> a sinusoidal wave (due to the flywheel effect of inductance and
> capacitance), but the envelope will become a square wave

The envelope is RF. If you see a squarewave, you have generated a
squarewave.

The flywheel effect can't make up for a total squarewave.

- with the
> attendant distortion, splatter, and so forth. I've seen people claim
> their linear is 75% efficient. Sure. Drivin into saturation, the
> actual waveform (including the RF across the active device) approaches
> a square wave (the rf cycles will return to sinusoidal in the tank,

Your mistaken here... They don't. Look at a spec-an, and see the
bazillions of sidebands created by the squarewave to truly see what
is going on their.

but
> the active device is turned on or off - nothing in between). This is
> similar to a switchmode amplifier (which is NOT linear) and switchmode
> amps can achieve efficiencies in excess of 90% (even including the
> driving power into the calculations).

Agreed, however, with waveform shaping, they are getting better.

The inverter I got in my suburban to power the filament and screen / grid
bias transformers is a close sinewave.

>
> The problem with these amplifiers is the nut behind the controls.

And the idiots who design them using the wrong ferrite because it makes
the wattemeter go farther.

Source record: 52038

The Bigradios.com domain is temporarily down.

I apologize for this. Seems the weather has knocked out the feed that powers bigradios.com.

That means the www site, as well as email is temp down.

I have talked to Chris about it, and he was going to go look and see what was going on today. I will be giving him a call later on to find out what he found.

We are working on rectifying this problem. I am going to be setting up a second www server, as well as have a backup mail server in the works. That way, if the mail server ever goes down, all messages will be queued instead of being returned. I have tested the mail queuing, and it is working, however, until we can get the modify done with internic, we are dead in the water for email.

I apologize for any inconvenience this may cause (bigradios.com is my primary email address, so I am really fux0red), and hope we can get it back up speedily (I leave town for California for a week on Sunday).

I will keep y'all posted as to the progress.

5527. Re: More Truckers Heard on 10M today

Newsgroup: rec.radio.cb
Date: 2000-09-14 00:00:00 UTC
From: Charles <charles@ab7sl.com>
Message-ID: <8pruo8$bn8$1@nnrp1.phx.gblx.net>
Source record: 52040

I hear them frequently on 28.525 and 28.535 running AM. It is usually "
mother fu____" " this and "mother fu____" that and other nonsense. They stick
out like sore thumbs with their carriers right in the middle of the band that
is always used by Hams for SSB. So they are easy to detect and I listen long
enough to ascertain they are truckers since I hear them talking about trucker
stuff like fuel costs or some babe they spotted a few miles back.

I just switch to AM...tell them this is where we run real radios with real
licenses and then politely tell them to get the fuck off the band. That
almost always does the trick. They don't belong there. I don't run on 11
meters (even though I could legally with 4 watts) and I sure as hell don't need
them cussing and splattering on 10M. I don't really care where a CB'r runs or
what gear he uses as long as he stays off the Ham Bands. It is a privilege
which is earned to operate there (Ham Bands) and freeloaders (freebanders) are
not welcome.

Before you tell me I don't know what it's like I was an electronics tech for
over 20 years and back in the 70's and 80's ran a 3-500Z everyday on 26.905 AM.
I also put 'extras' in many radios. Since those days I have gotten my head on
straight and have stopped being a criminal.

Maybe this might help you understand Available Power Levels At Amateur
Frequencies including their microwve freq.
Have you ever heared of moonbounce on microwave freq..
Rick

§97.313 Transmitter power standards.
(a) An amateur station must use the minimum transmitter power necessary to carry out the desired
communications.
(b) No station may transmit with a transmitter power exceeding 1.5 kW PEP.
(c) No station may transmit with a transmitter power exceeding 200 W PEP on:
(1) The 3.675-3.725 MHz, 7.10-7.15 MHz, 10.10-10.15 MHz and 21.1-21.2 MHz segments;
(2) The 28.1-28.5 MHz segment when the control operator is a Novice Class operator or a Technician
Class operator who has received credit for proficiency in telegraphy in accordance with the
international requirements; or
(3) The 7.050-7.075 MHz segment when the station is within ITU Regions 1 or 3.
(d) No station may transmit with a transmitter power exceeding 25 W PEP on the VHF 1.25 m band when
the control operator is a Novice operator.
(e) No station may transmit with a transmitter power exceeding 5 W PEP on the UHF 23 cm band when the
control operator is a Novice operator.
(f) No station may transmit with a transmitter power exceeding 50 W PEP on the UHF 70 cm band from an
area specified in footnote US7 to § 2.106 of Part 2, unless expressly authorized by the FCC after
mutual agreement, on a case-by-case basis, between the District Director of the applicable field facility
and the military area frequency coordinator at the applicable military base. An Earth station or
telecommand station, however, may transmit on the 435-438 MHz segment with a maximum of 611 W
effective radiated power (1 kW equivalent isotropically radiated power) without the authorization
otherwise required. The transmitting antenna elevation angle between the lower half-power (-3 dB
relative to the peak or antenna bore sight) point and the horizon must always be greater than 10°.

(g) No station may transmit with a transmitter power exceeding 50 W PEP on the 33 cm band from within
241 km of the boundaries of the White Sands Missile Range. Its boundaries are those portions of Texas
and New Mexico bounded on the south by latitude 31° 41' North, on the east by longitude 104° 11'
West, on the north by latitude 34° 30' North, and on the west by longitude 107° 30' West.
(h) No station may transmit with a transmitter power exceeding 50 W PEP on the 219-220 MHz segment
of the 1.25 m band.
§97.315 Certification of external RF power amplifiers.
(a) No more than 1 unit of 1 model of an external RF power amplifier capable of operation below 144 MHz
may be constructed or modified during any calendar year by an amateur operator for use at a station
without a grant of certification. No amplifier capable of operation below 144 MHz may be constructed
or modified by a non-amateur operator without a grant of certification from the FCC.
(b) Any external RF power amplifier or external RF power amplifier kit (see §2.815 of the FCC Rules),
manufactured, imported or modified for use in a station or attached at any station must be certificated
for use in the amateur service in accordance with Subpart J of Part 2 of the FCC Rules. This
requirement does not apply if one or more of the following conditions are met:
(1) The amplifier is not capable of operation on frequencies below 144 MHz. For the purpose of this
part, an amplifier will be deemed to be incapable of operation below 144 MHz if it is not capable of
being easily modified to increase its amplification characteristics below 120 MHz and either:
(i) The mean output power of the amplifier decreases, as frequency decreases from 144 MHz, to a
point where 0 dB or less gain is exhibited at 120 MHz; or
(ii) The amplifier is not capable of amplifying signals below 120 MHz even for brief periods without
sustaining permanent damage to its amplification circuitry.
(2) The amplifier was manufactured before April 28, 1978, and has been issued a marketing waiver by
the FCC, or the amplifier was purchased before April 28, 1978, by an amateur operator for use at
that amateur operator's station.
(3) The amplifier was:
(i) Constructed by the licensee, not from an external RF power amplifier kit, for use at the licensee's
station; or

(ii) Modified by the licensee for use at the licensee's station.
(4) The amplifier is sold by an amateur operator to another amateur operator or to a dealer.
(5) The amplifier is purchased in used condition by an equipment dealer from an amateur operator and
the amplifier is further sold to another amateur operator for use at that operator's station.
(c) Any external RF power amplifier appearing in the Commission's database as certificated for use in the
amateur service may be marketed for use in the amateur service.
97.317 Standards for certification of external RF power amplifiers.

You really think so?

I think $300 is a decent price.
These days the 6 tubes will cost you that much unless
you scrounge around. The power transformer is worth
a few bucks too.

If nothing else there's $300 in parts there.

I remember Dennis telling me that good 300As command
$300 to $500 these days--and that was a year ago or
more.

What tubes does it have in it?

If it is the smaller tubes with no plate cap, or a small 3/16 inch plate cap, a pair will take about 2 watts input, with a PEP of about 16

If it is the larger sweep tubes, like the 6LQ6 or 6LF6, I would drive a pair with about a 3 to 4 watt carrier, and as much PEP as a peaked radio can muster.

Footwarmer was a name like Palomar is today... Everyone and their brother stamped that name on it and sold under it.

Well, each person has their own price.

I wouldn't pay that much, because as you said, the tubes would cost that to retube it...

And then you have to modify it to drop the tube sockets (pc board)....

And a plate transformer is in the hundred dollar range.

I just can't see spending that kinda money, when for another hundred (or less), you can get a quad 811A amp...

Run the power through the 5 dollar radio shack 25 amp bridge...

That completely eliminates that problem from ever happening again (sans the bridge fucking up).

And then it doesn't matter which one goes positive and negative.

The radio always sees the correct polarity!

Hello yearight:

Please send ah findin fee of $300 to Jay in the Great Mojave Desert,
3rd trailer park on the right as U is goin into Edwards Air Force Base.

I need the Money real bad. I ah savin up fer a 1952 International
Pick-up truck, that has a old General Radiotelephone MC-11A and ah
Mustang 100 lineear amp. The paint is ah bit faded but runs like a top.
I all ready got a nice car, 1964 Buick with duel 102 inch whip antennas,
and fine rack of Bull Horns on the hood that was ah willed to me from my
people out back east, in Bullsgap Tenn. they got em from Mexico.

Now I figure it this way, If enough of you guys in your pyermiad send me
enough dollars I could be drivin this new 1952 International truck.
Lookin pretty good I might add.

Thanks ah million.

Jay in the Mojave

if someone has a set up like a 2 pill , pushing a 4 pill , pushing a 18 pill .
they are all call c amps which use 50% or less of the cycle . then the signal
that is coming out of that lat amp is only 12.5% of the origional right ?

is this what gives those big radios that crappy sound ?

>the big rig?
>

Mark 3 Was the 23 channel version

Mark 4 was the first 40 Channel Version, but was PROBLEM CHILD from
the word go... Mark 4A was thier major "bug" fix...

To be perfectly honest, if your looking to spend $500.00 why not just
get a solid state rig, those Browning Radios were GREAT, IN THIER
DAY... Things have come so far ever sense Browning folded... I mean,
parts for those rigs are hard as hell to find and when you do find
one, you usually have to pay out the nose for parts.

The Bottom Line?

Take that $500.00 and buy a new, Realible Solid State Rig with a good
warranty and save yourself alot of headaches...

Take from a guy who owned a Tram D201A and wished he'd never traded
his radio for it...

>Thanks.

Hi Reuben,

It depends on why they are sticking... if someone has been in there
screw driver'in the thing... best thing to do is get the service
manual and go through (or have a GOOD Tech, like Bill Nazdam at Bill's
2 Way) go through and straighten out the B.S. in the radio... also,
the speaker problem could be a loose or broken wire...

BUT! please, don't take to some bullshit backyard tech and have him
take it, keep it for 25 million days and then try to tell you it's
beyond repair... happens everyday here in michigan and it makes me
want to set up shop here in my house... but I won't because of the
headaches... anyhow... bill's URL is http://www.bills2way.com he's the
best dealer on the internet and a personal friend of mine... Go talk
to him...

You will need to find a VEC (Volunteer Exam Coordinator) near you to take the test. Often a local ham club will be a VEC. Look around on the ARRL web site and see if they give a list of VECs and see if there is one in your area.

Actually, any amplifier designed for AM or SSB is a LINEAR amplifier and CANNOT be a true class C amp. It must be a class a, ab, or b. I have seen posts stating that the zero bias amp, since you need 3/4 to 1 volt before anything comes out must copy less than 180 degrees of the sine wave. Well, maybe 179.999 degrees. A class B amp conducts (in theory) for exactly 180 degrees. Who is measuring? I doubt you'll ever get an amp to conduct for EXACTLY 180 degrees, if for no other reason than quantum mechanics probably forbids it. A class C amp usually conducts for LESS than 90 degrees of the electrical cycle. The big problem is overmodulation. People say you cannot overdrive an SSB signal. Well, you can flat-top. This is to say you drive the amp into saturation. On a single tone, this means as you increase the drive, what comes out approaches a SQUARE wave. Oh, the RF itself will remain a sinusoidal wave (due to the flywheel effect of inductance and capacitance), but the envelope will become a square wave - with the attendant distortion, splatter, and so forth. I've seen people claim their linear is 75% efficient. Sure. Drivin into saturation, the actual waveform (including the RF across the active device) approaches a square wave (the rf cycles will return to sinusoidal in the tank, but the active device is turned on or off - nothing in between). This is similar to a switchmode amplifier (which is NOT linear) and switchmode amps can achieve efficiencies in excess of 90% (even including the driving power into the calculations).

The problem with these amplifiers is the nut behind the controls.

FCC needs to prove you were transmitting. I don't know. I read some where
that possession of a tricked out police scanner with the ability to receive
cell phone band is illegal. maybe its like owning a handgun without a
permit? if you do something stupid with it, you busted. but if you are in
possession, in your own home, then who's going to know? sorry we need more
research on the mater. any lawyers out here? but then again a good lawyer
can manipulate the justice system so you come out smelling like a rose.

Jack,
I'm just not sure where to start. From your reply, I
get the feeling that you are not that familiar with what
an isotropic antenna is, or what they are used for. Your
refering to a 'spherical' antenna shows that you may have
the antenna, and the shape of the radiation pattern confused.
As for classifying an antenna according to how it's being
suported, or if it's even supported at all, doesn't sound
like it's a very useful thing to know when your still trying
to figure out how long it's supposed to be. But then, who
knows... someone may find that usable, I guess.
I did read your original post carefully, at least I did
the second time through, 'cuz I wanted to make sure I was
not mis-reading what you said. Personally, I really don't
care if we're talking about a Hertzian, Marconi, vertical,
or horizontal antennas. Finding the length of a particular
'size' antenna is found in basically the same way. There
are 'short cut' formulas for finding the approximate lengths.
The number you quoted for a particular length, while correct,

isn't ~as~ 'correct' as the one I quoted. Both would get you into the 'ball park'. The one I quoted is just a bit 'closer' to 'home plate'.
The best suggestion I can give you is to review what you 'think' you know about isotropic antennas.
'Doc

I would think that ~where~ you fed the antenna would
have more to do with what it's input impedance is, than
how long the antenna was.... We're still talking about
Hertzian and Marconi type antennas, aren't we?

You need an Expo "N" kit. Your choice of +/-. The upd2824 chip does not allow illegal n-codes. A upd2816 chip allows you to go down 455 KHz and you need to unlock the clarifier to get back to .xx50.

I'm not taking sides, since I have been on both, and I feel that both sides have valid points.
It does happen a lot!!!!! I won't call names, or callsigns, but do a check on NALs and you'll find quite a few. Happened here in NC just recently. Frequency was 27.375 MHz, and the surrounding SSB channels. Area of the state was Salisbury, and surrounding places. MOST of the HAMs that I know of that still "squat" on CB are Techs. They don't have the HF priveleges that allow them VOICE long distance communications, so they use CB.

Source record: 52056

Hello Richard: If you can adjust your antenna for the lowest SWR on the channel you hang out on, and the use of the Low-Pass filter will attenuate the unwanted energy big time. A good ground on the antenna mast is a big plus also.

Jay in the Mojave

It is a Hams option to use that much power if conditions require it and it
is permitted.
If you are going to spout off about things like this you better do some
research.
You act like a child.

Gary, I believe that happened to you. We have all had our experiences. For every scenario you present about cbers, I can give you another about hammies. Like you say, no interference to you, no problem. Many freebanders are not necessarily looking for quiet channels, but DX channels. Quiet doesn't always coincide with this scenario. Many foreign countries have call freqs on the off channels and they are NOT quiet. I agree that more cbers cause interference when they are running amps than hammies, and that is due to operator ignorance..one reason that you already stated...dirty equipment. I also agree that hammie bands should be left to the hammies.

Names of hammies that come to 11 meter with their modded rigs? By asking me for their names, you ASSume I have them, by me having them, you must ASSume they gave them to me. This isn't the mentality of the majority of hammies. You are damaging your cause.

Scot,
Here is another example of what you are saying.I know of about 8 hams here in my area that run illegal power.Two of them Have the Alpha amps that have the microprossesor controls I think they are the 87a model and they have them running at 2500 pep.Also what about the guys who run the henry amps they do 3 kw or more.I always thought the legal limit is 1500 watts pep.Am I wrong on this?I think that is correct.And another note to add is that the fcc says you shud run minuim power to make a contact.Well not all of us hams are d*cks.But most are getting that way.To be honest I have talked on the cb years before getting my ham ticket.And still talk on there.And this news group is a good place to learn.Almost all the cbers on here have helped me out when I have had a question.Later and cul Mike

Good words to consider.... And here is another possibility looming in the near future....

With the advent of the MURS VHF CB (if the info I read is correct) on the old itinerant frequencies and limited to 2 watts, those 2 meter rigs are certainly going to become "Big Radios". Most of them are already MARS/CAP modified to be able to bring up most VHF high band Law Enforcement/Public Safety repeaters, even though they aren't type accepted for commercial use. Even something like a Yaesu FT-50 handhold at 5 watts will be 2.5 times the legal output, and I imagine the deviation will exceed the MURS spec just like the 70 cm HTs being used to play "channel master" on FRS do. Can you imagine what a 50 watt 2m mobile (not an uncommon power rating) would due to a band where power is limited to 2 watts.

Radio Shack, Mirage (and I am sure others) sell amplifiers for handhelds designed to boost the 1 to 5 watt 2 meter handhold up the 20 to 35 watt area. The next step up would be the 10 to 25 watt in and 160 watt out level of FM amps or any of the Motorola strips taken from their commercial VHF mobile product and converted for RF sense keying. It wouldn't be hard to imagine a station capable of 150 watts in the hand of those who are "legally licensed" operators displaying their penal envy on the CB bands; much like they do on this NewsGroup.

If the MURS band becomes reality, it will be the first aggressive step toward clearing out the 27 to 28 MHz spectrum for possible future auction; something I feel we will probably be hearing more about as time goes on....

Your criminal attitude is exactly what sours most Hams about CB in the first place. If you disregard the FCC laws what other laws do you disregard? How about breaking into your neighbors house and raping his wife and children. According to your seriously flawed logic since other people do this crime it is automatically OK for you to do so too.

You and your kind are a bunch of seriously mixed up fuckers.

As an ocassional poster to this news group and user of CB Radios, I AM A HAM, yes siree, a BONA FIDE AMATEUR RADIO OPERATOR! Some Hams are not quite sparkling clean but then un-id'd operators on 10, 2 and some other meters are giving the Radio Hobby (The General Public thinks all radios are CB?!!!) fits. The proliferation of wideband transcievers are giving police and fire depts headaches and this doesn't bode well for the radio hobby in general.

Any one who values his or her ability to communicate in a free society will see that the proliferation of "illegal" "wideband" or other types of radio Trancievers will just allow the politicos to call for their banning (see HR 2346).

As a HAM, I have made a choice to folow the rules, as a MARS op, I use my radios on MARS Freq ONLY and as a CB Operator I run 4 watts stock stuff and .5 w FRS is a godsend to anybody with small kids on a camping trip.

By staying legal I avoid any hassle (I cross the US-Mexican-Canadian border quite frequently) and therefore simplify things.

Sincerely,

Martin N5PZJ (Landman)

Can somone answer me this question. I am working on a old Heathkit "Warrior" and I just replace a broken rectifier tube, Is it supposed to light up? There not illuminated at all. I checked pins #1&4 at the bottom of the tube and they are getting 2.5 V AC. After I turn off I feel the tube and it feels warm, is it working?

Also how do you key this boat anchor? There are some plugs in the back, do I need to hook up a foot pedal. Thanks for any help you can give me thanks.

Feel free to build one and find out.
1) where you choose to feed it has no effect unless you open it.
2) Soil conductivity certainly has an effect on efficiency, does not have much of an effect on radiation angle unless you got chintzy with radials
3) Unless you enjoy installing antennas at the bottom of wells
4) elevation doesnt change the direction of the maximum lobe.

Look up the Hy-Gain HyTower which functions as a 7/4 vertical on 10 and a 5/4 on 15, 3/4 on 20 and a 1/4 on 40 & 80. They will tell you the same thing in the manual.

The tendency of long antennas to end-fire is the basis of such antennas as the rhombic and long wire designs whether terminated or not.

Now that we both have vented our respective spleens, let us get to the root of the misunderstanding. You say, correctly, that it will give a vertically-polarized, more or less omnidirectional signal. Nothing I mentioned favors East, North-Northwest or anything of the sort. What you will find is that the main lobe will be concentrated at some angle above the horizon. The lowest radiation angle will occur with a 5/8 radiator (loaded of course) although the performance at 3/4 is not different enough to buy lunch. Low angles are generally considered to be better for longer distance work; the experimental proof was done in the 20s on this score.

Now sit down, cool off, and consider that antenna radiation takes place in three dimensions, not just two. Yes, there is an up-down dimension as well and it is this one which is affected greatly by the length of the radiator. No bigger deal than that.

Cross-posted to: rec.radio.swap,rec.radio.cb

FS: Chipswitched Uniden (President) HR-2600 in very good cond. Radio is continuous coverage from 24.800mhz to 29.9999mhz. Modes of operation are AM,FM,CW,USB and LSB. Radio has offsets and CTCSS for 10m repeater work. MRF-477 final was replaced with a new tougher MRF-497. 12m mod was performed and radio aligned. ALL work on this rig was performed by the best in the business "Valley West Electronics" who was a consultant in the development of the Chipswitch. Rig comes in the original box with stock mic, mobile bracket, DC Power cord, Radio and chipswitch instruction booklets, and I'll even throw in a brand new front panel and knobs so you can refresh it once you bang it around for a while. $175.00+Shipping e-mail me at: bbwolf@mailcity.com if interested.

In the long run of things you are going to be a lot happier replacing the tube rectifiers with some good 1 amp 1000 Volt diodes. But they should be getting 5 volts AC on the filaments, not 2.5. Might this rig have 120/240 provision on the power transformers. Are the transformers any good? The yellow wires from the xfmr should be 5 volts, the green 6.3 or so, the reds something you do not want to deal with. Pull the tube and check some voltages.

Be careful KRS!!!!

do you think your ham ticket makes you better than cb'ers ?

we deal with the same shit , thats just as illegal on 11 meters . you cannot go any where near chicago without some ratchet jaw on channel 6 , 11 or 20 bleeding over all 40 channels . so deal with it .

do you really think your the only people that get pissed off about some of the bullshit that goes on ?

why is your being pissed more important than anyone else ?

its not , thats why the fcc doesn't even bother to get involved in 95% of the cases .

i'll tell ya what , you write your congressmen ask him to ad a monthly tax for all them hams to fund the manpower to get all the bullshit off the radio .

or when you complain , you flip the bill for the equipment time used and the hourly wages .

get real and quit your crying , your no more important than anyone else

Well, some of what you put forth certainly has merit. I do not advocate squatting on any hammie band. I haven't listened to 10 meter in so long, so I'm not aware if the problem you allude to is so prevalent. I'm gonna take myself a listen tonight and see if hear anything. I'm not comparing hammies to cbers, YOU are. I have friends that are both. Bad operating procedures are not limited to either party. What I do see and hear all quite oftenly, is the hammie with his modded big rig, NOT on the freeband, but on the cb band. But you know what? We don't care. We'll talk to him just the same. This is extremely common where I reside and I live in one of the most active cb metros in the country. I've lived all over the country when I was younger and still do a great amount of traveling, and I can state without predjudice that I have heard many more hammies on freeband AND cb bands than I have heard squatters on hammie bands. Part of the problem, as you say, is the rules are wrong. Plain and simple. Not all of them mind you, but some of them. They are outdated (no dx) and make lawbreakers out of unintentional and unwitting ops. The crux of my argument here, is that if an op is shooting DX on a frequency that a hammie is not permitted on, why the hell should that hammie give two sh*ts? If two hammies are on frequency in the 10 meter band, in the same town, each running 100 watts, (happens all the time, I can point you to a net right now where this takes place daily) what justification do you have to cry about it when 2 cbers do it on an "off" frequency other than the "I got my ticket so you should have to also" mentality that seems to prevail among the freebanders biggest critics?

Richard are we talking about the same amp? The print I have for the Warrior reflects single transformer with 110V primary and a secondary voltage to the filiment of the rectifier tube @ 2.5 VAC. I see no other taps. I think you are referring to the 811 tube filiment Xformer. It has multi taps. As far as the other voltages and such, I still haven't investigated them yet. All the 811a filaments light up, and when I go to HV there is a loud hum. So I suspect the HV xformer is working. But yes going to solid stated diodes is something to consider.

I will be careful, thanks for the warning.

> So, I seriously doubt that licensed hams are using their unlocked
Yaesu's to
> impersonate CBers on 28.435 USB. No, those are people with RCI's and

Once again you are wrong in your thinking. I've heard plenty of folks
both locally and around the world using kenwoods, icoms, etc. What
cber in his right mind would spend over $1000 just to freeband
or "invade" 10 meters from time to time. NO these guys are hams and do
the same thing the outlaw cb'ers you seem to hate so much do.

>Galaxy's
> and whatnots who have gotten 'deals' from some online dealer or
truckstop or
> mod master. They turn the bandswitch and transmit, totally unaware
of what

yep there are several folks out there that see a "big and fancy" radio
and buy it just because it's "sooooo much better than a plain old cobra
or uniden" and play with all the freqs. You also have the truck
drivers out there that buy the export radios etc just to get away from
the noise on the cb band and want a more private channel to talk on and
just don't give a damn where they are. I've seen them personally, guys
that just go and buy a galaxy 44v and keep it planted on channel 19 and
just flip the band switch to talk on a "quiet channel" if skip is high
they just keep flipping the switch higher and higher until it's quiet,
normally that's right in the middle of 10 meters.

so there are dumb ass people everywhere. big fucking deal. You find
them in the cb band, ham bands, on the internet, driving in front of
you, at work, at school, in line at the grocery store. Dumb people
break the law sometimes out of thier own stupidity, deal with and stop
who you can but you'll never be able to stop all the stupid people in
the world.

> frequency they are on. And what I am saying folks, the crux of my
argument
> here, is that quite a few in this NG are encouraging it and becoming
part of
> the problem.
>

perhaps.... but you aren't going to stop those people. and most people
that ask how to mod this or where to buy that are not going to listen
to what you say anyway. They are going to find the information they
are looking for regardless of your postings. About the only people you
will be stopping by all your posts are those who are totally ignorant

about radio and honestly don't know the difference between a "walmart special" cb and a modded ft-100 or rci 2950.

you are wasting your time. choose your battles, this isn't one you will win.

fire:

When he speaks of radiation angles, he's speaking of the angle in the
Z axis (from the ground up). Not 55 degrees east of north, or any such
nonsense.

Your statement implies two dimensional thought, which, although
common, leaves out an important component.

Yes, a 5/8, or even a 5/4 vertical is omnidirectional, in two
dimensions, but the signal strength at an angle above the horizon
changes. 5/8 has a lower radiation angle than 5/4.

Just my two cents

Well I got my start on CB. Got my first love for DX on CB channel 4 one day with 4 W out and a ground plane when someone in North Carolina broke in and told me that my barefoot Kansas based station was covering up their locals. Right then and there I was an unwilling lawbreaker by working DX without any intention. I agree there needs to be something done about CB but enforcement is the problem. Shortly after that I became a freebander (1973) and was a radio criminal for the next 15 years and had complete disregard for the FCC rules even after getting warnings from them.

Then I got my head on straight, gained respect for the law, got my ham ticket and stopped being a criminal.

Source record: 52167

Many commercially sold Ham HF amps will do 2500W easily with 100W drive or less. Yes I am sure some Hams run them that way too. However most do not (it is rarely really necessary anyway on uncrowded civilized bands) but they do run them at 1500W all day everyday and get great longevity from them due to the headroom the bigger amp offers. There are bad apples in every hobby. I am sure somewhere there are illegal stamp and coin collectors too so this issue of who runs what and where is a waste of time. All one can do is make sure their own house is clean .

Some time ago I quit being a radio criminal (freebander) and am ever the better off for it. Now on the Ham Bands instead of trying to 'DX' across the country and thinking that is a big deal I can routinely work stations on the other side of the planet as often as conditions permit and completely legally. My DX logbook is always online at my website for public viewing.

Source record: 52170

Charles,

I was at the Shelby, NC hamfest a couple of weeks ago and there was an ample supply of illegal equipment available including the modded CB rigs that would go from 25****MHZ all the way up into the 10 meter band. There was a group of CBers selling everything from "BIG COIL" antennas to those "DAVEMADE" amps. This year was the worst I've seen there--and Riley Hollingsworth said it was bad last yr. This is also the reason I know the FCC agents will be at Shelby in '01. I'm not trolling, just stating the facts. So what I saw does support the thread about hams not caring who they sell to just so they get the money.

Last year at Shelby, I had an Amateur amp. And knowing that Mr. Hollingsworth was there, I put a sign on it stating that I would only sell to a licensed ham, and a copy of the license must be presented. That was (1) to comply with the law, (2) to prevent it falling into the wrong hands due to my carelessness, and (3)to keep from being cited for violating the law for selling amps to non-hams.

That's not being exclusive. I just do not want to get into trouble, and I want to keep the license I worked hard for. I, like you, had to pass more stringent tests than are now required. I see the need for change, but it shouldn't be watered down or just handed out like candy. That's the impression I get from some of the posts--they want it given to them. If anything, the technical questions such as RF Safety, frequency allocations, emergency procedures, and on-air etiquette should be made harder.

No, it's not illegal to modify radios for MARS/CAP use. Sorry, you're wrong. It's not illegal to have a radio capable of TXing out of band, etc. It would only be illegal if it needed to be type accepted by the FCC, and FCC rules state you can modify up to 1 of each model of a radio each year (ie. I could modify a TH-78 for mars, and a th-79, but not 2 th-79's without getting type acceptance). I did the MARS/CAP mod to my th-79a because I wanted access to the rest of the UHF band (which belongs to hams....420-450...before the radio only went 438-450)

It lets you choose horizontal or vertical polarization, each has its benefits.

-SSB

On or about 15 Sep 2000 20:48:07 GMT, dukkhakoti@aol.comblahblah (beaker), using the forum rec.radio.cb did say:

:what good does dual polarity do ?
:

You can tell what I know of Heathkit Warriors :-)

What sort of rectifier does it use? Sounds like a MV type. In which case
you are going to have to use stacks. If it is a good one, then you might as
well stay with it.

I had the Warrior pictured as something else, not even an amp. So I will
withdraw all comment and slink into the weeds

Dick

> the problem.

Problem???????? A problem is your teenagers shooting each other in the classroom. A problem is Crackdealers selling crack to police spending 2 hours in jail , and right back on the streets selling again. Transmitting on frequencies above or below 27MHZ is not a problem.It is a nusiance..... You guys waste more time in this NG bitching about this subject, in Vain! your posts are'nt gonna change a thing. Not everyone in this world follows the law as some of you guys do. Get over it!!!!! Some people choose to transmit out of band...that is their problem why should you care. If they get busted , they'll do the time. sheeeeeesh!!!!

Who would really think changing hobbies would change a persons value system or their respect for the law or their fellow man. All those virtues come from growing -up, accepting responsibility for your own actions and becoming a responsible and respectable citizen.

There are plenty of CB'rs -and- Hams who will never do any of the above mentioned character building exercises. Either they feel they don't need to because they see other similar low-lifers all around them or they take a weird sense of pride in being a law-breaking risk-taker. Some get caught but most don't. All one can do is get their own act together.

Depends on the drive level, which makes the difference on amperage draw. I also use WAY small pulleys on my AC alternators, which causes me to get better voltage output at a given rpm.

I CAN quote you numbers, but they will be totally meaningless, since each box behaves differently... The grounded grid / screen box is a hell of a lot more efficient than the grid driven box, as far as plate efficiency goes.

However, for drive level, the screen voltage one will draw more overall current from the power supplies, but it also needs less drive (like the diff between a volted 8 pill and a single pill driver)..

Because at 13 grand carrier, I would need about 19 grand total output.

I prefer to run the screen voltage enabled box, and have it dead key about 5 thousand watts.

Needs about 50 watts for that to happen :)

Toll Free

Exactly.

You CAN get total overall power in far excess if you run a high carrier, and let it come back (if you have the electric power to run it).

However, it isn't all about what that Bird will tell you... You can have shit average power, but still run extremely high peak envelopes and key on someone who makes the Bird go over farther.

I'm not sure that I was in my right mind, but I did just that. LONG
before I decided to become an Amateur, I purchased a NEW Kenwood rig,
just to "freeband" with. I had already tried the Galaxies, and other
junk, and was sorely disappointed.
Once I had the abilities to listen to the Amateur bands, I realized that
I would be much happier there. Sure there is crap on the HAM bands, but
it is much, much easier to get away from, than it is on CB.
Now when I decide to operate CB, I use a box stock CB rig. Most times
I'll listen on the Kenwood, and transmit on the stock radio. I don't talk
there much, because of all the noise, but when it is quiet in my area, I
still enjoy CB.

You can get a capsule description at
http://www.heathkit-museum.com/ham/ha-10.html

Now that I know what it is, no the 866s aren't going to get warm until you start pulling some current thru them. The filament in a MV rectifier doesn't do all that much heating.

It appears you heard all the right sounds for a startup but you should have just a tad of resting current when you figure out how to key the high voltage; I don't think 811s are generally biased right to cut-off. You may get some interesting noises out of the swinging choke that is used.

These amps were generally keyed from the exciter with a defeat switch to allow barefoot operation. The high-voltage is interlocked with the filament and bias supplies to prevent applying HV before the tubes are ready.

The web site I gave you has sources for poop sheets. Sounds like a worthy investment particularly if you have to go thru the neutralization procedure.

Good Luck. You have a potential jewel on your hands no matter how old it is.

Dick

5657. Re: Does anyone have a 4 element moonraker design/measurement manual around

Newsgroup: rec.radio.cb
Date: 2000-09-15 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <39C1F389.734C5650@qnet.com>
Source record: 52204

Hello James Bond 007: May I suggest, you find a Moonraker 4 on E-bay or look around the CB shops and locals for a new one, or even a used one.

The Moonraker 4 has kind of a special design, in that all the elements except the reflector use a not so common arrangement of parts and pieces to make up these elements, the directors and driven element are made up of aluminum tubing, that fit inside each other, or telescope inside each other, and a stainless steel end piece, that is approx. 12 gauge in diameter.

Trying to duplicate these elements can be done, but you half to realize that in the reproducing effort, you will not probably get all the exact materials, that will mean the length of these elements will half to be changed to compensate for the different lengths vs the different diameters. This called length correction for tapered elements.

The Moonraker 4 directors and driven elements use 5/8 inch aluminum tubing mounted into a square hub mounting bracket, and then have a piece of 1/2 inch aluminum tubing telescoping into the 5/8 AT. the end of the 1/2 inch aluminum tubing is flattened and has the piece of stainless steel 12 gauge rod attached to it. If you use for example 5/8 then 1/2 and then 3/8 aluminum tubing, the element will half to be made shorter, to be electromagnetlly equivalent to the original Moonraker 4 element.

Or you can simply find the original type materials, such as in the 12 gauge stainless steel ends, and duplicate the element dead nuts on, as to what the Moonraker 4 has.

The 4 each element mounting support brackets that the Moonraker 4 uses is a piss poor design. These brackets are cast aluminum. There have a notch in them for having a 1/4 inch screw to tighten down against the 1 3/4 inch diameter boom. Because these are cast aluminum, they are not made to be severely tighten, and result too many times in breaking.

I would suggest using 6061-T6 aluminum sheet metal, .080 or .070 thickness
as the sides for a new bracket. And "L" brackets bolted to the element mounting bracket, and use hose clamps to clamp against the "L" brackets to the boom. Some Moonrakers 4 and 6's have had a problem with having the element support bracket spin on the boom which will throw a lot of things out of adjustment.

E-mail me your US mailing address and I'll send you the assembly instructions.

Jay in the Mojave

I've personally seen a few operating the limit on 2m and 440 (and hear
of others), so I'm sure more than a few have tried operating at the
limits on frequencies higher than that. In other words, if the rules
allow it, I'm sure someone has tried it. And that is why safe operation
on those higher frequencies is covered in the license exams.

But, what is the purpose of your question? There are a lot of ham
operators out there, and a lot of frequencies available to ham operators
in the VHF, UHF, and higher, bands. Therefore, I can't possibly know
which frequencies each ham operator, using higher power levels, is
using. Since that is rather obvious, your question seem more rhetorical
than an honest attempt to seek an answer.

I agree with most of your post. But doing the modification and owning a modified radio are not illegal.

FS: JoGunn 3+3 Star 3 element Beam
In used, but in very good condition
Includes a machined sleeve to reduce mast diameter to 1 1/2"
also have instructions.
$180 + you ship

Here are the specs
TYPE: Horz. & Vert. Polarization Twin Feed
GAIN: 14.5 DB
FRONT TO BACK RATIO: 40 DB True
SIDE REJECTION: 40-45 DB True
BACK REJECTION: 40 DB True
WEIGHT: 28 lbs.
LENGTH: 8 feet
SWR: 1.1
HORZ. to VERT. SEPARATION: 20-25 DB
WIND SURVIVAL: 100 MPH
POWER MULTIPLICATION: 40X
AUDIO GAIN: 18 DB
WIND LOAD: 2.8

Hi all,

Scott makes a lot of valid points. For years, I've wondered why hams are always clamoring for mods for their rigs, especially those which permit their gear to transmit outside the ham bands. The so-called "MARS" mods are a perfect example. If a ham is actually an active participant in a MARS program, fine. If not, there's only one real reason to make such a mod... to transmit outside the ham bands. I suppose I'm the exception to this. I have owned many synthsized HF rigs (all Kenwoods) over the years, and I've modified all of them for general coverage transmit. My reason? They make a really fine, stable, accurate RF signal generator! I can't afford expensive test equipment, and the general coverage transmit modification allowed my rigs to serve two purposes. No, I honestly did not use any of them to transmit outside the ham bands (I have no interest in doing so). As I said, I am the exception. I know many hams, most of whom are holders of Extra class tickets, who "freeband" as much as, or even more, than they operate on the ham bands. As for modifying their VHF and UHF rigs to transmit outside the band limits, there's no real reason except to operate somewhere they're not supposed to. I know one ham who's an auxilliary Sheriff's deputy, and he uses his modified Kenwood TM-241A to talk to the Sheriff's Department. Practical? Yes. Illegal? Definitely! I will admit that I once use my opened-up Alinco DJ-F1T 2m handheld to communicate with my other VHF handhelds on 151.625 MHz. Practical? Yes. Illegal? Definitely. I did it on one occasion, because we were short one radio (my car club uses them at car shows to keep staff members in touch during the shows). I haven't done it since, and I won't do it again. I am not "on a high horse", so please don't flame me. There is indeed a lot of hipocrisy among hams. They think they're being sneaky by not letting anyone know that they're operating illegally. What they usually don't know is that they're not fooling anyone but themselves.

I doubt if any of us old enough to have a 1x2 -- note yours has your
initials -- have not done something on the dubious side of legality in our
careers. One of the 17th District FCC engineers was pretty well known to
consider that the old 1kw limit applied only to the filaments. I am
probably among the few who ever used 11 meters as an amateur band, on a Tech

license to be sure, but WTH; it was the only band where SSTV/Fax was legal.

But there is a difference between a quiet disregard for the law and disregard of the law for its own sake. Modding a rig for no better purpose than listening (or talking) to the staff at the local Mac&Dons or just to be a rebel without a clue is just not in the same league with what you are talking about. At least there was a purpose to it that did not involve "Look at me, I'm Sandra Dee, lousy with virginity". As you said, no real purpose except to transmit where they're not supposed to.

In the 27 MHz range, it is no big deal; these are garbage frequencies to begin with and the band was cleared to 28 MHz years ago. Unfortunately, the ease of freebanding has given a lot of people the idea that it is as easy and acceptable everywhere; people talking about opening up their Marine radio to get the non-existent channels 29-62 gives anyone with any knowledge the creeping willies. A bit of TVI is one thing, killing people or interfering with making a living is something else entirely.

The difference is attitude and unfortunately the acquisition of a Amateur license doesn't make a whole lot of difference in that arena. Point well made, Dean.

Dick McCollum N0BK -- first licensed November 1954

Ok X. That is the first serious attempt you made at real dialogue. I understand your position and just for the record, I do not agree with talking on the hammie bands if one is not licensed. But badmouthing all folks who own export radios is not the answer. There are WAY more hammies with modded rigs on 11 meter than there are outlaws who squat on 10 meter, and to borrow part of your own post, you can't change the facts. You keep this issue "hazy" and keep reverting back to the hammie band subject. Why not put your efforts into that as well? Doesn't appear that you are concerned with any hammie radio violators, just cbers who talk out of band with their modded radios. Sounds like selective enforcement on your behalf.

I went to local HAM Flea market last Saturday morning. Among the usual items for sale, most HAMs were selling modified CBs. The worst part is that they were quite blatent about it too, with signs on top of the radios stating "out of band modified" or "includes extra channels".

One HAM was giving his sales pitch to a bunch of kids how his modified Washington that he had for sale allowed him to talk to Europe. I asked him if this was illegal. He just looked at me, and then started telling the prospective buyers about how the modulation had been improved to make them sound "louder".

It is somewhat hypocritical. I guess they feel it's okay if they can make money out of it, but wrong if they catch a non-ham using it.

Richard.

What would happen if you had an antenna that was longer than 1 wavelength.
For example a 10/8 wave antenna, the equivalent length of two 5/8 wave
antennas ?

Doc,

You're posturing again. An isotropic antenna is a
perfect SPHERE with its feedline connected at the center.
Since the feedline breaches the surface of the SPHERE on
its way to the center, it only exists as a theoretical
reference. You're off topic. I thought we were talking
about hertz and marconi type antenna systems here. What
the hell are you talking about?

If you bothered to read my post instead of merely skimming
over it you would see that I included the 468/ formula for
antennas that are supported at the ends, as in the case
of the antennas which are currently the subject of this
discussion. As a matter of fact, I included the formulas
for antennas supported at the center, as in the case of
the dipole antenna, as well as the "unsupported" antenna
in "free space".

Come again?

Hello Smokey Hill Mobile:

Ain't been back home for some time now, so I don't remember the off ramp.
Most of my family there are farmers and ranchers type ah guys.

There was a old boy there who made a really mean base linear amp. I can't remember his name. He was a ham, and community radio technican and all. This amp had two Eimac 4CX250's or 4CX350's that would do a grand in a hart beat. The tubes where in a class B push-pull circuit, and could be drived from a stock radio to a 100 watt ham radio. I saw one at the TRW swap meet in Los Angles a few years ago, but it didn't stay unsold for very long. I think his name was Guss, or Buford and he was just a gold person and all. I'd sure like to get in contatc with this guy.

I am due back home this next spring, and I am going to look him up.

You don't mention just what kind of channel mods the Ham had done to the CB rig. It is perfectly legal for a US Ham to mod any CB rig to go on any Ham band but usually 10M. There is nothing wrong with that and it is done all the time.

Well, I'm sorry you took it that way, Barry. I answered your question the only way I could - I don't know. But, again, that would seem rather obvious (without study, how can anyone know what a large number of people are doing), which is why I was left wondering about the intent of the question.

Perhaps you misunderstood the content of my previous comments. I never said that I knew of anyone using high powered equipment on any frequency. My comments were limited strictly to the rules, which would allow such operation. And the need for a license exam because of that possibility (and other reasons).

Many hams are hippocrites. What bothers me is the fact that not only are most current 2/440 radios modified illegally by their Ham owners, what's worse is that they will go to a Hamfest or Ebay & proudly sell it to any Stranger when they want to unload it. They don't know the dude they are selling it to, and a modified 2M rig can do a lot more harm on Police/fire/ambulance frequencies than a modified CB on "channel 58 or 47 27Mhz" could ever do. These same idiots "make fun of" & talk down about CB owners with extra channels...........

At 5/4 it would be resonant but have its major radiation lobe about 55
degrees above the horizon if memory serves. Long antennas tend to end-fire
whether vertical or horizontal.

Impressive on your roof, though :-)

On the contrary pea brain, there is no attempt at transparency. It seems you have less common sense than the average geranium. I dont think its possible for the posters of this NG to be more open in what they think. It would be hard find a more outspoken group of people. Anyway its clear to me that you are a whinning twit and have nothing of value to offer the CB NG, so your postings are going in the kill file. End of story.

Richard,

Not a bad idea. Any antenna that is an odd number
of quarter wavelengths long will provide an excellent
match to 50 ohm coax. The antenna you mention would
be 5/4 - five quarter wavelengths long. Try ground
mounting over a buried wire - radial system for best
results.

Yes, unfortunately there are a lot of CB types that also hold an amateur radio license.

Source record: 52239

<< Ok X. That is the first serious attempt you made at real dialogue. I understand your position and just for the record, I do not agree with talking on the hammie bands if one is not licensed. But badmouthing all folks who own export radios is not the answer. There are WAY more hammies with modded rigs on 11 meter than there are outlaws who squat on 10 meter, and to borrow part of your own post, you can't change the facts. You keep this issue "hazy" and keep reverting back to the hammie band subject. Why not put your efforts into that as well? Doesn't appear that you are concerned with any hammie radio violators, just cbers who talk out of band with their modded radios. Sounds like selective enforcement on your behalf. >>

If hams mod their radios and use them to talk out of band they are wrong and should get popped. If hams use modded radios and high power to talk on CB they should get popped, too. And there is a much better chance of them getting popped than the average Joe.

Problem is, you are trying to compare a licensed ham who posesses a transmitter capable of operation on frequencies from 1 to 30 MHz to a totally unlicensed person with a modded transceiver.

You probably already know this, but the legal basis and purpose of amateur radio includes technical experimentation. Quite a few hams build transmitters to use on HF, VHF and UHF. There are some that even buy old broadcast transmitters to convert to 160 and 75. They have ample opportunity to make this equipment transmit on many unauthorized frequencies. There usually isn't a problem with hams straying into other services. And when there is, serious attempts are made to stop it.

Now here is the truth. All the hams I've ever talked to that have the wideband transmit mod on their transceivers have tested it once and then never used it again. Having it just makes them feel good and prepared and ready for some national emergency or Armageddon or something. LOL.

However the unlicensed person buys the modded tranceiver (Galaxy, Ranger, etc) specifically to use it on unauthorized frequencies (25 to 32 MHz) or at unauthorized power levels.

In this NG I was surprised to see an attitude of absolute 'indignance' - that anyone would dare infringe on the right to use any frequency available and as much power as one wants in a CB radio.

There is no such right. The legal basis and purpose of the Citizens Radio Service is short range communications. The plain and simple fact is that 4 watts and 26.965 to 27.405 is the only privilege you have as a CBer.

So, I seriously doubt that licensed hams are using their unlocked Yaesu's to impersonate CBers on 28.435 USB. No, those are people with RCI's and Galaxy's and whatnots who have gotten 'deals' from some online dealer or truckstop or mod master. They turn the bandswitch and transmit, totally unaware of what frequency they are on. And what I am saying folks, the crux of my argument here, is that quite a few in this NG are encouraging it and becoming part of the problem.

Richard,

Aren't you just the wizard? You must be able to
remote view antenna sites from thousands of miles
away to be able to ascertain all of the variables
that effect the radiation lobes of an antenna system.

Such as:

1# feedpoint height above ground
2# conductivity of soil at site
3# local topography/"lay of the land"
4# elevation

I could go on, but what would be the point.
I'm satisfied that I've made mine....

And what is this endfire crap? An antenna
that is 5/4 wavelengths long in the vertical
plane, end fed, produces an omnidirectional,
vertically polarized signal.

What a guy. What a bunch of bull.

73,
NAO911/Jack]

>Don't miss the point! I have been licensed since 1976. We all know that ham radios are being modified for out of band transmission. It is not a question if the mod is legal. It is a fact that we hams know that these radios are being modified for illegal use. Many Hams modify Ft-100's for use on CB bands when on the road. They do not just listen, and that is a fact you and I both know. I have heard for years the excuses for such mods. I am only defending the CBer against an equally guilty offender. My interest in radio started with CB in the late 60's to early 70's. I see both sides of the story. It is the attitude of many hams that give CBers a bad attitude towards ham radio in general. We should work to move CBers interest to legal operation of HF radios. Legal use of mods with the correct licenses are not the issue. You are the exception to the rule!

>> I hear them frequently on 28.525 and 28.535 running AM. It is usually " mother fu____" " this and "mother fu____" that and other nonsense. They stick out like sore thumbs with their carriers right in the middle of the band that is always used by Hams for SSB. So they are easy to detect and I listen long enough to ascertain they are truckers since I hear them talking about trucker stuff like fuel costs or some babe they spotted a few miles back.

I just switch to AM...tell them this is where we run real radios with real licenses and then politely tell them to get the fuck off the band. That almost always does the trick. They don't belong there. I don't run on 11 meters (even though I could legally with 4 watts) and I sure as hell don't need them cussing and splattering on 10M. I don't really care where a CB'r runs or what gear he uses as long as he stays off the Ham Bands. It is a privilege which is earned to operate there (Ham Bands) and freeloaders (freebanders) are not welcome.

Before you tell me I don't know what it's like I was an electronics tech for over 20 years and back in the 70's and 80's ran a 3-500Z everyday on 26.905 AM. I also put 'extras' in many radios. Since those days I have gotten my head on straight and have stopped being a criminal. <<

and i am sure every body goes 45 Mph , in a 45 Mph zone .
you never take more than 20 items in the fats lane in the stores .

people this is real life , few people follow rules , why should the fcc's rules
be any different ?

do you hams actually think your rules are more important than any other rules
we all break ?

i don't know what kind of fantacy world you guys live in but it must be nice .
you guys need to get a grip

The radio in question had a frequency chart taped to the lid. As well as the regular CB channels, it allowed the radio to go from 27.415Mhz up in blocks of 40 channels (0.01Mhz apart if I remember correctly).

Richard.

i had fun rebuilding a seriously crashed Jo-Gunn 4V from scratch.. All that i really had was the Gamma which survived (otherwise i wouldnt have looked twice), and the boom section...The rest was a call to The Dillsburg Aeroplane Works in Dillsburg PA...Only cost me 80 bucks for all the parts to rebuild the elements, plus get the rubber caps and gamma hardware from Jo Gunn... Not bad considering the price new.. I havent checked lately, but i thought Moonwrecker 4's were still around 200-220 bucks..Are you building it for shits and grins and to say you did, or trying to build a sleeper budget antenna ?? :) Just curious. Time fer a beer.. 747

<< The feds have been receiving complaints from hypocrites like you for years. Unless it is a safety complaint or from a LEA, your complaint goes right where folks are beginning to place your posts. >>

Threats and name calling can't change the facts. More crap is showing up on 10 Meters every day. If you're on 10 meters without a license - you're a poacher, plain and simple. As evidenced by the questions in this newsgroup, many newbies have no idea what frequencies, power levels or modes they can legally transmit on. So if you're selling or helping to enable equipment that covers 25 to 32 MHz for/to people who don't know any better, then you're a contributor to the problem.

Of course, it sounds like a few people are "enthusiastic" contributors. You can drag out all the "hams" you want to testify that export radios are no big deal. Bear in mind, many of them have a stake in keeping those export radios on the market, either because they are dealers or repairers of such equipment themselves. Or they are selling and building CB linears and rules don't matter to them. Or they are casual no-code techs with very little investment in ham radio. Either way, they are not typical hams.

I can't believe with all the crap I hear from CBers on 10 meters there's not MORE hams complaining here in rec.radio.cb.

5716. It just amazes me about hams. HAMS READ!

Newsgroup: rec.radio.cb
Date: 2000-09-15 03:49:49 UTC
From: Big Dog 326 <scott_326@my-deja.com>
Message-ID: <8ps68ojie1@nnrp1.deja.com>
Source record: 52126

I have always been amazed how ham radio operators always put themselves above the law. For example: the majority of ham sites have a section they call mods. These modifications cause out of band transmit (freebanding!) and just because you call it a mars mod-it is still illegal. I have known hams for years (I am one!) and I am amazed how ham operators modify their radios (mars mod!) as soon as they buy it. Yes, ham radio operators do modify there radios (example: UHF radio-mars mod-now used to talk on FRS radio freqs. and higher than legal output) Also, hams flip switches and cut diodes to make there HF radio all band transmit and talk on so called freeband freqs. everyday. Ham radio operators seem to think that holding a ham license somehow gives them more rights to violate FCC regulations-IT DOES NOT! If anything, those that have ham licenses should set the standard and live to a higher code than do 11 meter freebanders. I am always amazed how those hams that violate the law look down at CBers and try to tell those operators that THEY are violating the law. Trust when I say, that if you go to Ebay and bid on a radio such as a Yeasu FT-100 being sold by a lincensed ham operator, 9 times out of ten it has all ready been modified for out of band transmit. WHY? Is that not illegal? Why did he see fit to make this mod? The answer from a ham is for emergency only operation! Well I am glad that when the world is coming to an end, we have all these ham operators ready to rock with their illegal radios! Come on fellow hams, give CBers a break until you stop the mars mods and follow the letter of the law yourselves. I do, how about you? I know CBers with better equipment and better operating proceedures than do some fellow hams. I like CBers who run clean equipment, stay off the ham bands and operate in a professional manner. There are people on this NG that have more tech. knowledge than many hams. I like to read this NG and myself have picked up on some good tech. info. But, fellow hams, take a look around your own radio room and justify the illegal mods you have made to your radios. You can't, you won't, end of story!!!!

5717. The "legality" Question Revisited

Newsgroup: rec.radio.cb
Date: 2000-09-15 04:02:15 UTC
From: an@ny.mous
Message-ID: <39c19cd7.67665542@news1.lig.bellsouth.net>
Source record: 52127

Once again, I'd like to make a point in regards to the legality of owning particular models of radios. The Galaxy radios sold within the United States that are not specifically type accepted CB radios, are 10 meter tranceivers. If someone gets one, and modifies it to transmit on non ARS frequencies, then they are in posession of a modified 10 meter tranceiver. If this is in fact illegal, then there are many, many hams that own modified tranceivers, and in fact the modification information is freely available at many popular amateur radio websites. Are the licensed amateur radio operators breaking the law by posessing 10 meter radios modified to transmit on non ARS frequencies?

Paul

But we're talking about as much as 1500 watts, not 100 watts. That is
the limit legally allowed on some ham radio frequencies. And when
you're talking about the higher frequencies, safety around 1500 watts is
a real major concern.

Good post, Rick. And, Mark, thats why ham radio operators are tested on the rules, radio safety, and proper equipment operation. The rules we have to live by are enough to make a person's head swim. And the equipment we are capable of using does pose a great risk if not use properly. With that in mind, it is entirely reasonable to require a license exam and license.

5721. READING THIS WILL CHANGE YOUR LIFE

Newsgroup: rec.radio.cb
Date: 2000-09-15 04:41:09 UTC
From: americancruiser@aol.comocozzy
Message-ID: <20000915004109.14219.00000318@ng-cj1.aol.com>
Source record: 52131

READING THIS COULD CHANGE YOUR LIFE!
I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was dubious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?"
Then I invested the measly $6.00. Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, why it works....Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy!

Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is virtually no risk - it really works!!!! If all of the following instructions are adhered to, you will receive extraordinary dividends.
PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list.
Here are the 4 easy steps to success:
--STEP 1:-- Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST."

Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

#1)R.L.
1601 Lakeside Ave. #108
Richmond, Va 23228

#2)Liz
2904 Laurel Cherry Way
The Woodlands TX, 77380

#3)S.A.
65 Brunswick Blvd. #223
D.D.O, QC Canada (use $0.45 stamp)
H9B 2N4

#4) D.B.
5411 Shirlington
Memphis, TN 38115

#5) NVC. 9017 DENISON AVE
CLEVELAND ,OHIO .
44102 (33 CENT STAMP)

#6) TONI, 5910 DEERING AVE
PARMA HTS OHIO 44130
(33 CENT STAMP)

--STEP 2:-- Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.
--STEP 3:-- Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the Honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way.
NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that

you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)
So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS----------

--Step 1)-- You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
--Step 2)-- Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
--Step 3)-- Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to.
--Step 4)-- Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.)
--Step 5)-- Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! **REMEMBER,THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST AMINIMUM OF 200** That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THEADDRESSES ARE CORRECT.** Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1. make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just

take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will really work. Don't let this exciting opportunity pass you by!

well i have heard that he is dropping the ball on all of his projects.
Just who in the hell is building their units these days?,.hmmmmm??, i
think they are farming out their stuff, and a lot of crappy work is
being sold under his banner. game , smell the coffee and admit it. the
days of davemade are coming to a end, unless of course they make
corrections in quality. I am not going to plunk down a bunch of money
for junk,........cd is out........

Well said. I have been a ham for only one year and noticed the same thing.
Luckly hams that consider themselves the "RF Police" are in the minority.

I did MOD 3 and it works great. While that website above shows
the correct wiring, it has the pinouts for Q127 (2SC3242A-E)
labeled backward.
The diode cathode is connected to the transistor emitter (not
base as shown).

<< Once again, I'd like to make a point in regards to the legality of owning particular
models of radios. The Galaxy radios sold within the United States that are not specifically type accepted CB radios, are 10 meter tranceivers. If someone gets one, and
modifies it to transmit on non ARS frequencies, then they are in posession of a modified
10 meter tranceiver. If this is in fact illegal, then there are many, many hams that own
modified tranceivers, and in fact the modification information is freely available at many
popular amateur radio websites. Are the licensed amateur radio operators breaking the law
by posessing 10 meter radios modified to transmit on non ARS frequencies?

Paul >>

Ahh....that's right....keep the issue hazy....spread some doubt.....keep the newbies from asking too many questions.....keep the hams
asleep...sleep.....don't no one rock the boat...it might disturb sales of 25 to 32 MHz radios designed for the CB market and all the illegal activity on 10 meters.....

(You guys are so transparent, LOL)

5727. Mobile solid-state amp for sale or trade

Remember it is illegal to use this device on citizen's band radio frequencies!

This was bought from someone in this newsgroup about a year and a half ago:
Messenger 175 with professional pill-swap to make it a 250 (yes it is a two-pill), three-position power switch, preamp, nice condition. Works great, I will have a professional shop put it on the bench tomorrow to check the output.
Just had the preamp rebuilt (it did not work) and this unit has had less than five minutes of use between the time I bought it and now! Only a minute last week to check the preamp and it works great!
Sold "as is" with no warranty or guarantee, but I will guarantee this arrives in working order unless it is smashed during transit. I am a private party and not a shop.

No set asking price, will ship to USA only, will consider giving the amp plus some cash in exchange for a nice used 2950.

<< Ok. I understand your stated position on the export radios and you are certainly entitled to your opinion. But isn't that a little like suing the gun manufacturers and tobacco companies, for lack of a better analogy? It isn't the product, it is the people who buy these products and what they do with them. Which in turn would lead us back to enforcement issues. If the feds were to take cb ops to task for violation, going after safety infractions, interference, dirty equipment, splatter, I would have no problem supporting that. There is enough spectrum out there to accomodate most radio ops. Even the keydowns and competitions, can be assigned space where noone would be affected. But splatter sometimes cannot be avoided. Conditions dictate that even barefoot ops across the country sometimes can bleed you a channel or two away. >>

Uh oh, I think we are coming to terms and respecting each other! God help us! LOL!

I agree you can't legislate everything, but such things as drivers licenses and traffic signals are regulated and do keep the roads from becoming chaos. And notice that the tobacco companies -did- get sued and were made to pay. I think that although everyone is responsible for themselves, any society requires some regulations, especially when it comes to substances, products or practices that undermine the common good or limit the freedom of all.

It is a touchy and difficult subject, similar to the gun issue in some aspects. The problem as I see it is that while firearm ownership is protected under the constitution, a citizen's use of the radio spectrum is not. The fact that the freeband is not legally recognized as a legitimate venue is a big hurdle for those that want to operate there. And it doesn't look as if the FCC will reverse its policy towards this anytime soon. Meanwhile, the bozos who show up on 10 meters with export radios make you all look bad.

---clipped---

I think I am staying on topic. Your "#3" formula is one normally associated with an isotropic antenna, because it does not take the velocity factor of wire into account. In the real world, your "#1" formula is the one normally used to find a 1/2 wave length , no matter how the antenna is supported. No idea where you got the figure for formula "#2", since it seems to have no relation to any practical 'real world' measurement.
I am well aware of what the topic of this thread is. Attempting to understand your misleading and meaningless distinction between end-supported, and center-supported antenna lengths is probably the only 'mistake' that I've made.
'Doc

PS - Hint: 1/4 = 234, 1/2 = 468, 5/8 = 615.

AH!
good question!

A "trap" is a parallel tuned circuit that changes the loading characteristics
of an antenna, based on its initial design resonance.. if you are a little low
on
the band you are working, the trap imparts some inductance to allow the antenna

to work more efficiently... since it is also a tuned circuit with a capacitance
in it,
it will appear to be a high impeadance at the 2nd or third band the antenna is
deigned to work (its as though you took the ends beyond the trap and removed
them).

say the anteannis designed such that you have 2 bands you can work (80/40
meters
for example). this can be a single trap design where the total length of the
antenna
BEFORE the trap is a resonant 1/2 wave (as a dipole) at 40 meters... now, as
you tune
down to the lower band, the trap starts to act in such a manner as to become
almost invisible
tbetween the 2 lengths of wire it sepperates (a dead short circuit). for the
bands in question,
such a trap would have a natural resonant frequency in the range of megahertz.

I think I may be starting to ramble, so I'll sum up:
its basically a lot like a switch that allows you to either add or remove the
extra wiire elements
in a dipole antenna so that it functions correctly on the 2 bands you are using
it for.

I am not very technical at exsplaining things so here it goes but this is what I have gathered about why different ferrit mixes. The different ferrite mixes have different permability, meaning they assist in creating different magnetic fields strengths. When you have a ferrite with a high permabilty it will cause the transistors to conduct more because the magnetic field is stronger, again this is because of the different properties making up the mix. This is why you can get away with less wraps on the transformers when dealing with a mix that has a higher permability. The only problem with that is that with less turns on the transformers there is a higher chance of having a impeadence mismatch to the low impeadence device. So that where the turn ratio comes in, its usually five wraps and will put it within a couple of ohms. So there is pros and cons to all this.

ever hear of conservation of energy.
sure, you can generate huge voltages in such a design, but without the current (so your power is still the same). P=I*V change volts up and you have to change current down by the equivalent amount.

Nope, just saying that voltage at the tip has nothing to do with an antennas ability to radiate and the reference that states otherwise is wrong. No reason you could not have the voltage maxima in the middle of an antenna. It would not be a 1/4 wl mobile CB antenna though. For example if you center feed a doublet and each leg is 1/2 wl long the center of the antenna is a voltage node. No big deal. It is done all the time.

5740. Re: It just amazes me about hams. HAMS READ!

So you are saying that an 87a will do 2.5 kw and a Henry will do 3 kw? Which model? Better take a close look at the tube specs before jumping to conclusions. Henry DOES make a couple models capable of this--generally not sold to non-corporate accounts because they cost as much as a new car. There is no benefit in running 2500 watts as opposed to 1500 watts. A guy listening a thousand or ten thousand miles away would not hear a difference, and everyone should know that the strength of the signal is determined more by the nature of the antenna than the pep of ths signal. This thread is sounding like a convention of crybabies.

Part of the problem though is abject ignorance of the bandwidth. Most of these radios are channelized and often lack a display of the actual tranmitted frequency, so the user has no idea without a counter where his signal is going. Secondly, the user may not know what frequencies are legal or illegal. Remember, there is no expertise presumed in the sale of a cb. The use of a gun is somewhat more obvious than the use of one of these radios. Presumably you know what you are generally aiming at with the gun, and if you are close enough you might even hit the entended target, but you certainly can't see, feel, or hear the signal of the radio when it is transmitted.

5747. Re: It just amazes me about hams. HAMS READ!

Newsgroup: rec.radio.cb
Date: 2000-09-16 00:00:00 UTC
From: JR <jr@some.net>
Message-ID: <39C366B3.DD1E31BB@some.net>
Source record: 52265

So what is illegal about a ham owing a transmitter that will transmit out of band? Every "ham band" transmitter I have ever owned would transmit several kHz either side of the ham band frequencies. My Collins 32V-3 AM transmitter covers the following frequencies:

Band Ham Band Coverage
80M 3.5 - 4.0 3.2 - 4.0
40M 7.0 - 7.3 6.4 - 8.0
20M 14.0 - 14.35 12.8 - 16,0
15M 21.0 - 21.450 19.2 - 24.0
10M 28.0 - 29.7 25.6 - 32.0

So you want to tell me that Collins sold an illegal transmitter for amateur radio use? I suggest you need to spec up on the regulations a bit more.

Any one got any info on this CB'er?

Goes by "1412" "in the Descil Car" <sp> Long distance Truck driver...

I believe his personal is "Tom" ... Not sure really....

Any information at all on this guy?

Thanks!

POTH!

if y'all used it more there wouldnt be so many clear freqs. how come when the dx activity is high theres not a freeband freq that goes unused yet ten meters is almost if not completely dead. use it or lose it. it may not be fair and it may not be legal but it is life.

>Problem is, those rigs are the ones that are to blame for the spate of 10

New baby (and wife) forces sale!
I have the following equipment for sale:

1) Uniden HR2600 with Chipswitch installed. 12 meters through 10 meters. Near new condition, little used, never mobile, non-smoker. Comes with Mic, bracket, power cord, original manual (including for the Chipswitch) and box.
-$225 shipped Conus
2) Connex 4800 DXL. 12 through 10 meters. Export model. 40+ watts output. Brand new, in the box. Extra cost power tweak, frequency alignment. and clarifier unlock performed by Left Coast Radio. Paid over $380 3 months ago.
-$325 shipped Conus
3) Texas Star 350 HDV (High Drive Variable). 2 x 2879's. Designed to be driven by 15-30 watts. Perfect for either of the above two radios. Brand new, in the box. Never used except once to verify operation.
-$185 shipped Conus
4) Boomer 250 Deluxe High Drive. 2 x 3749's. New, in the box. Adjustable power settings.
-$110 shipped Conus

All of this equipment is in top shape and the best you will find anywhere. Always indoors in climate controlled environment. Never around cigarette smoke or bumped around. If any items are not as advertised, I will refund your money (less shipping back to me). This equipment has not been tinkered with and is fully stock condition unless otherwise noted.
Feel free to e-mail me with any questions.
-Darren

Disclaimer: Some of the above equipment is illegal for use in the U.S.. Buyer is responsible for complying with all laws in his jurisdiction.

Heheh...yea.have to agree with ya' on the bad ops. As you say, just like anything else, there are always bad apples to rain on someones parade. Just last night I checked those freqs,but I couldn't hear anything. We are in the bead of a tropical storm (might be a hurricane by now, I didn't check the weather today yet) so that could affect our coditions, but I did hear some conversation on another AM station that just happens to be a DX call station on the upper side. And..yea, they were definitely truckers..talking about hauling rocks..faded out real quick though. As I stated previously, I can't believe...scratch that...I am not aware that the problem is that prevalent on 10 meter, but then again, I hardly ever go there. Wouldn't matter a bit to me if my radio didn't even get the 10 meter band. Hollingsworth did say the 11 meter band is his next target for enforcement, but ops have been hearing this for so many years it has desensitized them from any fear of real reprisals. Seeing how Hollingsworth has actually stepped up enforcement of the hammies, it may just be a matter of time IF they decide to actually persue the matter.

Well there are many DX contacts that last for quite some time depending on conditions and how rare the DX is. Also some operators in certain countries are more prone to being long-winded then others. Australians especially are well-known for being rag-chewers.

I would suggest that if the style of DX'ing on the Ham Bands doesn't suit you then just stick to 11 M.

Ok. Poor analogy with the gun issue. What I was getting at is personal responsibility and yes, I agree many ops do not know where they are transmitting many times. Speaking of freq counters, Radio Shack had a blowout sale on their discontinued TRC-485 mobile radio with 40 channels upper and lower for 59 bucks. Grabbed one for a spare, and it has a freq counter. What do you think THAT was put there for?

It has been a century or two since I dealt with 866s. Six of them (3-phase supply) got a lot of sleep supplying 6kw to an FM transmitter. They are brutes.

In SSB linear service, voltage regulation under load is a big issue. Your amp uses a swinging choke that goes from 5 to 50 henries depending on current demand and has a good sized output cap to iron things out. But the biggest item is forward voltage drop across a rectifier. High vacuum rectumfriers have a significant forward resistance so mercury vapor rectifiers were used instead; they are a kind of glorified fluorescent tube. This is not your average 5U4. In a lot of ways they behave like solid-state diodes with a fairly fixed drop across a column of mercury vapor that glows a neat blue under load.

The purpose of a filament in an MV rectifier is simply to heat the mercury vapor a bit. In no way shape or form does it resemble a tube filament. I don't recall ever seeing anything resembling a regular tube glow. If you are getting some warmth, call it even and move on.

I do suggest getting the poop sheets if at all possible. In the meantime, can I suggest a line of attack. You have four power supplies:
1. A 2.5 volt for the 866's. The main HV + lead will come from there so be

careful already. You seem to have verified that this works.
2. Filaments for the 811's. Don't move the tap but understand that 811s are a bit pissy about adequate filament voltage. Each one draws four amps and you have four of them so the filament wiring will be some serious wire gauge. The r.f. input circuitry will involve these leads. In a grounded-grid (that means the grids are at rf ground and the input is thru the directly-heated cathode) so the rf input is in this somewhere.
3. Bias for the 811's. The grids are at rf ground but have some sort of stiff dc bias. They would run dead grounded in Class B so I have no good idea just what or how it is being accomplished.
4. The main B+ which should be in the vicinity of 1250 jolts. Deal with that after figuring out how it is keyed.

In this order:
1. verify that you have the 6.3 for the 811s and some sort of bias. Does this rig have a switch for mode? Because of the plate dissipation ratings of the 811 you are limited to 400 watts of Ancient Modulation, 650 in continuous carrier service (FM or RTTY) but can go the full gallon on CW or SSB. That might be what the bias supply is for.

2. The keying circuitry is as much a mystery to me as it is to you. Pull the plug and trace the B+ lead from the 866 heaters and the B- (the red/yellow lead on the power transformer) and figure it out. Unless the B- is bolted firmly to ground, it would not be surprising to see the rig keyed here so begin with B-. They may also key the 120 volts to the power xfmr. So your next assignment is to trace it out and make your own schematic.

This unit has what they call an interlocked keying circuit. All this means is that before plate voltage can be applied, filament and bias voltages must be available. I suspect you are going to find a small relay in the 6.3 line which keys the bias supply which powers some moose relay that actually does the job. The actual keying I would guess is done by completing a ground to the moose relay coil. I notice the terminal strip on the back that kind of leads to that idea.

This amp does not appear to have an ALC circuit but rather gives you a scope output for monitoring linearity. Might be wrong tho.

3. For yours and everyone elses convenience, list out the knobs on the front and be sure you understand their functions then every terminal on the back.

If you don't want to continue this on the group, feel free to e-mail me. You kind of have me curious. From what you describe so far, I have the feeling the old beast is going to fire up and work good.

BTW, you are aware that this will take about 75watts to drive it aren't you?

Dick

The FCC would do better with their time to bring some LONG overdue enforcement to the 2m machines in that area. 145.350 in particular often gets out-of-hand. The Concord machine is no church picnic late at night, either.

Thanks for reading!

While perusing through the local hamfest this past weekend I happened on a nice looking Siltronix 1011D. This unit was purchased for a small amount of money and is in good shape however, it did not come with a power cord (mobile or home AC). I wondered if anyone out there could assist me in getting this rig up and running by providing me a little insight on the pin-out for powering this rig on 120V AC. Would also like to get the modification to allow this unit to transmit on 11 meters. I have searched the net looking for this information to no avail. Anyone with some insight on this could e-mail me at:

riverty@ntslink.net

Thank you in advance!

ONCE AGAIN:

You still missed the point! Answer these questions: Why do hams modify
their HF gear for all band transmit?
Why do hams modify UHF handhelds and use on FRS freqs. It is not if the
mod is legal or not. It is the use of the
modified radio on unauthorized freqs. and at power levels above those
allowed by the FCC. 5 watts+ are not legal
on FRS freqs.! It is hams who try to split hairs and find loop holes in
FCC regs. to justify what they know is
illegal and at the least unethical.
This is why when a fellow ham trys to tell the honest truth about the
violations within our own hobby, you
always get those who sight chapter and verse of FCC regs.. You and I
both know what is right and what is wrong.
There is always room for interpretation of FCC regs.. Trust me when I
say that a ham who fires up his 5 watt
handheld to talk on FRS freqs. is in violation of the law. Common sense
always rules in our hobby. Don't site
FCC regs. to justify what you know is wrong. Next time you see an FT-
100 in a fellow hams car, spin the dial
and see if it will transmit on 27Mhz. And then ask him why he had the
6kHz A.M. filter installed in this unit. As
I said, common sense always rules. The same splitting of hairs is used
by manufacturers of export radios and
11 meter linears. Is a texas star a CW transmitter? Does ranger
produce radios to be used in the 10-12 meter
ham bands? We all find the same loop holes to justify what we know is
not the intent of FCC regs.!

I would like to get a CB that I would only use on long car trips to mostly avoid speed traps and maybe have an conversation or two on a longer trip. I don't really have room to install a unit in the car and was wondering if a handheld with decent magnetic antenna for the roof would be good enough for me.

I was looking at either a midland or cobra handheld. Would this work okay for what I want to do? Any suggestions/comments appreciated.

I can't hear those machines from here. I do very little VHF. A lot of the
2m repeater crowd are Technicians, and still play around on CB a lot.
Anyone that judges Amateur radio by only listening to 2m repeaters, or 75
phone is not really getting the real picture.

TW,

You are right--it is only a matter of time. I am not going to start insulting people over what they do, but, on the other hand, I do oppose the illegals ops up on 10. I don't even care about the freebanders above Ch 40 (I do about the ones below), they are responsible for their own actions. From your posts, I think we both agree that it is wrong for 11 meter ops to be on 10 meters, and wrong for hams to take their ham equipment onto 11M.

Riley Hollingsworth's home town is just 25 miles south of me. I once had the opportunity to talk with him personally, and the reason I believe that more enforcement is coming is that it came straight from him. The equipment has been installed, and he is still dealing with the bad apples in ham, and as soon has the enforcement on the ham bands is done, you'll see more in other areas. There was one ham, for example, that called himself "Captain Truth" on CB and ham freqs. I'm not sure if he got an NAL, but he lost his Extra Ticket. I know they hit a truck stop about 10 miles from here on I-85 and confiscated some equipment (export rigs and amps) from about 8 truckers. The wheels turn slowly sometimes, but when the initiative comes, it'll probably take a few folks by surprise!

Incidently, I tuned thru the lower end of 10 yesterday and heard a constant stream of those "squeaks, squawks, and roger beeps". Most of what I heard was Spanish, but there were some stateside ones, too.

Jerry

I have to agree that Mongoose radios are not manufactured as well as the top three. Bassman had mentioned that he was not sure how the new Rangers would hold up in trucks. We work on hundreds of units each week, and the new Ranger radios have the least repairs of all. Ranger has designed their 6900 series and the DX series on a SMD board. These radios are the most durable radios on the market. There is nothing that comes close. You may want to check out one of these sites.

Kurt,
in general, hand-held receivers are not the 'best' in the world.
A small mobile radio used with a cigarette lighter power plug and
a mag-mount antenna may work out better for you.
'Doc

Yea...we see eye to eye on the issue as far as squatters on 10 meter. I went to the 10 meter band today and I heard a bunch of AM'ers but as you say, they were Spanish stations..whch isn't rare here in the 'pile. We hear them routinely just about everywhere on the spectrum. Since we are on the subject, what is it that you object to on the lower band? The military monitoring thing? I know much (not all) of these frequencies are pretty much dead, even though they are assigned to petroleum services, forest, etc. I do hear an op in Burns, Oregon down there on a fairly regular basis who works for the forest service on the swing shift and DXes all night long.

Gary: In no way did I state that all hams mod radios and use in an illegal manner! But it may be bigger than you think. The whole intent of my post is for hams to realize that many of the things that CBers do, many hams are doing with some mightier than thou attitude. I too started in CB in the late 60's. I became licensed for much the same reasons you did. As all hams don't violate FCC regs., either do all CBers. Only a small portion of CBers venture into 10 meters. If you have retained your interest in CB for this many years, you must have heard a ham or 2 on 11 meters. Do you think they turn off their Yeasu 767GX and flip on their Cobra base to talk CB. Or is it they just spin the dial to 27Mhz and talk away at higher than legal power with a non type accepted transmitter. I have been licensed since the 1970's. I have bought and sold many radios. Been to-two-to many hamfests to count. Known 100's of hams through the years. What we would like to think does not happen by those who are licensed, does not change the fact that mods are being done, hams talk on 11 meters and freebands with moded ham radios, handhelds are mars-moded and used on FRS freqs. If you know no one that is into this side of ham, then you need to get out a little more often! P.S. A good friend of mine has owned a CB store in ND since 1976. He sells no linears or exports to CBers (Never has and Never Will)! But he has a big market to ham radio operators. Ask him what they are truly using them for! It must be his imagination also!!!!!!!!!

Nobody is stopping _anyone_ from communicating on CW. This issue is
whether it should be a licensing restriction. Face it, it's going
away. Maybe the technical tests should be toughened up, but the hurdle
of CW hasn't kept sleezeballs off the air. It was the lack of FCC
oversight that let the bands get polluted. Now that they are back on
the ball things may get better. If we ever get to the level of
technological and social collapse that renders CW as the only comm
mode available , the availability of CW is probably the _last_ thing
on you're agenda

This is true, but just to clarify a thought, when DX is running on 11,
it's running on 10. They are very similar bands.

No that is not always the case twisted. 10M is an odd band that can have DX
even when lower bands (such as 11 M) are dead.
There is quite a bit about propagation in the ARRL Handbook.

Hello,

I have a base station that a friend would like to sell.. It is a Uniden Washington base rig. The radio is in mint condition. It comes with 2 president matching external speakers and a Astatic D 104 Silver Eagle.

The asking price is $350. Any questions please email me.

Thanks,
Stephanie.

The reason I'm here, is that occasionally someone will ask a question
that needs a straightforward answer. I try to answer them. There are
times when answers are totally wrong, and someone needs to offer an
alternate viewpoint.
I don't buy, or sell here.
I don't care what others practice, as I don't have to pay the fine.
Almost forgot. I enjoy the hell out of Ice Cold's jokes!!!!!

Hello Don: Now that is the pot calling the kettle black!

I really enjoy the Don type of hams, goofy and totally disconnected with reality. I once went to a ham radio club meeting that was put together to help out the local city for disasters such as earth quakes, fires, power outages, floods, all that kinds of bad stuff. Well one of the goof balls stands up and says that the special disaster helpin hams should have VIP parking, special Licence Plates, and get this, a card to be identified as a disaster communications coordinater so that they won't get traffic tickets, and a uniform! I couldn't help but to laugh out load, what a goof ball.

But I felt sorry for the other real type of people who where hams, red cross guys, county & city communication guys, and there was even a local private radio communication service guy offering his help for free.

The group finally got all the people coordinated and everyone is singing from the same song sheet. During the last big desert deluge rain the emergency group acted quit fast and efficient, good going to all those great guys.

I still hear the old goof ball on the local 2 meter repeater, and yes he's a mono tone, know it all, whiner. One of the new guys will say Ten-4 on the repeater, and Mr. Goof Ball gets wrapped around the axle in a New York second. Funny, now everybody says Ten-4 on the repeater now.

I ah gonna ware up me echo mic for the 2 meter radio, just for him.

Jay in the Great Mojave Desert.

That's less than they've been bringing here in excellent condition. Usually
$300-350 around here.

Scott,

Jerry is NOT an exception to the rule. I'm sitting here with
two HF rigs, and three vhf/uhf rigs and NONE of
them are modified.

There goes that theory.

Having said that, I know that many hams do modify their rigs, and
for
many reasons. The only one that I can speak for is myself.

Personally, I did start on CB and still retain an interest in the
band.
I'm not ashamed of that, its no secret that may hams started
there and many
still use CB. I finally got my ticket and one of the reasons why
was that I wanted
something better and did not want to keep looking over my
shoulder for
the dreaded FCC van.

What reallly hacks me off is the spreading of CB/freeband radio
operators
to every frequency range. Why should I, who are licensed for a
particular band,
have to put up with CB'ers infiltrating, say, 10 meters? Why
should I have to
put up with interference originating on 27.125 wiping out my SSB
conversation
on 28.350? Why am I blamed for TVI/RFI/BCI originating from CB
stations? If you
guys could contain the mess to the 11 meter band say from 26.965
to 27.995, I
would have no complaint.

As it is, you have no basis for your complaint and no ground to
stand on with
your arguments that "Hams all do it so get off my back!" Sorry,
this self-justification
just won't wash.

Just my $.02

> the rest of the UHF band (which belongs to hams....420-450...before the radio
> only went 438-450)

> You still missed the point! Answer these questions: Why do hams modify their HF gear for all band transmit? Why do hams modify UHF handhelds and use on FRS freqs. It is not if the mod is legal or not. It is the use of the modified radio on unauthorized freqs. and at power levels above those allowed by the FCC. 5 watts+ are not legal on FRS freqs.! It is hams who try to split hairs and find loop holes in FCC regs. to justify what they know is illegal and at the least unethical.
This is why when a fellow ham trys to tell the honest truth about the violations within our own hobby, you always get those who sight chapter and verse of FCC regs.. You and I both know what is right and what is wrong. There is always room for interpretation of FCC regs.. Trust me when I say that a ham who fires up his 5 watt handheld to talk on FRS freqs. is in violation of the law. Common sense always rules in our hobby. Don't site FCC regs. to justify what you know is wrong. Next time you see an FT-100 in a fellow hams car, spin the dial and see if it will transmit on 27Mhz. And then ask him why he had the 6kHz A.M. filter installed in this unit. As I said, common sense always rules. The same splitting of hairs is used my manufacturers of export radios and 11 meter linears. Is a texas star a CW transmitter? Does ranger produce radios to used in the 10-12 meter ham bands? We all find the same loop holes to justify what we know is not the intent of FCC regs.!

Huh?

Please try to justify this statement. Why would somebody who is
licensed for 10/12/15/17/20/30/40/80160 meters (not to mention
UHF/VHF/SHF) squat on 11 meters?

Please provide proof of your accusation. Names, Frequencies,
recordings etc. so that we can see for ourselves the truth
of your allegations.

Thanks!

Gary

Source record: 52076

OK, since you asked, I'll tell you.

If the QSO described below was happening on 11 meters,
and NO interference to any other service occurred then no
problem.

What has happened is that the two 11 meter operators are
generating interference and are totally uncaring about it.
Either their amps are oscillating and generating spurs
on my or other frequencies or the usage of the amps causes
interference to local TV's and radios. Both of these
have happened and are happening. This is a fact.

Then there is the all-too-frequent "lost" CB'er. All he knows
is that he bought his radio and It has a channel selector
and band knob, and by golly, if his radio transmits on
channel 57a that is all he cares about. He does not
know or care that channel 57a is actually 28085 and
FM transmissions there obliterate the legal CW QSO's
there.

So, I say again, as long as 11 meters operators keep the
hash and trash on 11 meters, great! Have at it!

But you and I both know the reason your two 11 meter
operators are on the freeband in the first place is that
you can't control the trash on the lower 40 either. You
are looking for a quiet place to have a chat.

SO AM I !?!

SO, to reiterate, just keep the freeband outta MY band!

Thanks es 73

Gary

Source record: 52079

In the hobby of CB radio, X349 (Also known as:Still-living-with-mom and I can't find a job thats pays over minimum wage!) would be termed an "agitator"! His whole purpose is to degrade others in response to his own short comings (such as fat, stupid and could not find a date if his life depended on it)! As you all know, if you do not respond to his agitation he will slink back into his poor empty life and go away for awhile. During that time we can hope he meets a blind girl who may have pitty enough to go out with him until she learns through a seeing friend how butt ugly he really is. In reality we should feel sorry for X349. How would you like to come home at 2 A.M. from your shift at Taco Bell and turn the corner going into your room, only to scare the hell out of yourself when to catch a glimpse of your butt ugly image in your hallway mirror. As in all agitators: If not reponded to, they all go away! It is the fact that we respond to his mindless banter that he exists on this NG. Some day when he is 42 years old and he moves out of mom's basement he will be gone for ever from the world of agitation. Until then, lets all make a pact not to respond to his low self esteem driven commentary. And always remember than when you meet a short fat little boy, who lives with his mommy and smells like a soft shell taco, you may have just met the one that calls himself X349!

5828. HR 2510s for sale

Newsgroup: rec.radio.cb
Date: 2000-09-16 02:22:42 UTC
From: Gordy Gale <gordygale@home.com>
Message-ID: <39C2B021.877C9DA2@home.com>
Source record: 52082

Just got these back from the repair tech and they are good to go. Both come with box, manual, stock up/down mic, mounting bracket (but no thumbscrews), and power cables. One has mini speaker jack mod on back, the other is stock with accessory plug. MRF 477 finals, and 26.000-29.666 AM/FM/SSB/CW and really talk. $150/each plus priority mail and insurance and tracking. US Post Office money orders or Paypal only. NO CODs.

> a real major concern.

Actually, the new ISO radiation safety standards for human exposure
can kick in at 50 watts or even less, depending upon distance to the source
and frequency. Because different organs and parts of the body might
"resonate" at different frequencies, it's not quite as simple as saying
that X-watts are safe at any frequency.

For example, at 1.2 Ghz, a 50 watt signal at close range may
burn cells in your eyeballs and heat the vitreous fluids. Think
of a 50 watt microwave beam vs. a 50 watt AM signal.
Which would you rather stand next to? :)

5830. Re: 1/4 vs 1/2 vs 5/8 Wave - Theoretical Question

Newsgroup: rec.radio.cb
Date: 2000-09-16 02:31:13 UTC
From: fire228@my-deja.com
Message-ID: <8pum1h$e3d$1@nnrp1.deja.com>
Source record: 52085

Doc,

I already have a working understanding of an isotropic source/antenna,
but obviously you don't. And it doesn't have a thing to do with the
formulas or the 1/4 wave, 1/2 wave or 5/8 wave antennas that were being
discussed here in this thread. The only thing that I don't understand
is what the isotropic source has to do with this discussion. And you
can't explain this in any way that will prove to anyone that it has
anthing to do with this message thread, either.

You brought it up, not me.

Hope this answers the question........

73,
NAO911/Jack

It would, if your looking for an isotropic antenna in free
space. Now I ask you, what do any of these formulas have to do
with an isotropic source/antenna/radiator?

Here are a few urls for your further study.

http://www.ee.surrey.ac.uk/Personal/D.Jefferies/antennas.html
http://www.ee.surrey.ac.uk/Personal/D.Jefferies/antprobscollected.html
http://ewhdbks.mugu.navy.mil/Glossary.htm
http://web2.airmail.net/gerryc/newham/nhp2.html
http://www.antennex.com/preview/Folder03/Jul6/cfameas3.htm
http://www.cebik.com/p.html
http://www.njin.net/~magliaco/slot.html
http://www.khaltex.net/glossary/satellite.htm
http://www.sdtv.com/Glossary/glosstext1.html
http://www.intersat.com/glossary.html

No Doc, I am not confused at all. An isotropic
source/radiator/antenna is an antenna that radiates
equally well in all directions. Again, it exists
only in theory until the technology exists to attach
a feedline to the center of the sphere without interrupting
the radiator surface. (Real funny, Scott)

Let me reiterate once more with regard to the formulas.

1# 468/fmhz for 1/2 wave, end supported antenna

2# 478/fmhz for 1/2 wave, center supported antenna

3# 492/fmhz for 1/2 wave, no end effect/free space

The only thing I'm confused about is why you find yourself
unable to stay on topic. Again, just in case you forgot,
the thread is:

"1/4 vs 1/2 vs 5/8 Wave - Theoretical Question"

5832. Re: More Truckers Heard on 10M today

Newsgroup: rec.radio.cb
Date: 2000-09-16 03:34:47 UTC
From: x34956171135@aol.com
Message-ID: <20000915233447.22781.00000030@ng-fr1.aol.com>
Source record: 52087

If you want to hear truckers and outlaw CBers on 10 meters, listen during the day at 28.000, 28.0025, 28.050, 28.075, 28.100, 28.150, 28.200, 28.225, 28, 275, 28.350, 28.375, 29.000 and up.

I appreciate all those who've encouraged others to stay away from the 10 meter ham band. It's called peer pressure and it's not a bad thing.

OK, it sounds like what you are saying is that you'd like to be left alone to "freeband" from 27.405 to 27.995 without hams complaining. Fine. I could care less what you do in that band segment (although it sounds like the linear thing is getting a bit out of hand. We can hear your splatter up on 10 quite often).

And I can almost understand why you want those illegal quasi-10-meter "ham" radios like the RCI's and Galaxys and what-nots to remain available on the market.

Problem is, those rigs are the ones that are to blame for the spate of 10 meter "invaders". Those truckers and other boneheads are twisting knobs till they get a clear channel, and you know where they end up, smack in the middle of the amateur band.

I blame those that sell them, manufacture them, fix them, mod them, swap them, and help keep them on the market, whether they are hams or not. Nothing personal, that's just the way it is.

As the10 meter interloper problem worsens, more hams will start to sit up and take notice. They (or the League) could even begin to explore ways to put pressure on the manufacturers of these "export" CB rigs. I certainly hope so.

Here is a great place for the info and a link for the MURS Mailing list.....

http://www.provide.net/~prsg/murshome.htm

Very complete rundown, including NPRM. FAQ, Citation and Abstract.

also a link to the eGroups MURS Mailing List and the MURS / FRS websites..

Looks interesting

Good points here also. Even without the subject of freeband usage or unauthorized access to public safety frequencies comes the subject of type acceptance. A CB is type accepted, a commercial VHF or UHF rig is type accepted, marine band is also type accepted and the list includes more than these few examples. A Ham transceiver HF, VHF or UHF is not type accepted. Ham rigs have never been required to meet type acceptance (that I know of), and their use in commercial spectrum or that designated for type accepted devices only is just as "illegal" as freebanding with an export radio or Ham rig. It's like being "Kinda Pregnant"; either you are or you aren't. I recall the advice often offered: "People in Glass Houses should not throw stones".... We have a society based on governance that uses a large percentage of it's resources to make criminals out of a large percentage of the public. It is hard not to violate some type of law; even with the best intentions guiding your actions....

Message-ID: <8puu2j$5fp$1@slb0.atl.mindspring.net>
Source record: 52091

You can have horizontal polarization for SSB and Vertical for AM. There is also the chance to narrow the bandwidth for the SSB portion of the Band on the horizontal (textbook 27.365 to 27.405 MHz) and on the vertical optimize it for 27.965 to 27 355 MHz. it may even be possible to set the vertical up for CB and the horizontal up for 10 meters, since the antenna length gets shorter as the frequency goes up. I have seen 11 meter beam antennas cut down for 6 meter 50 - 54 MHz operation ......

And I agree, Ross. But I never said anything about the safety of wattage at any frequency. All I said is that the rules allow to use of high wattage, so the exams test for safey concerning high wattage.

So, if some guy can figure out how to do it safely on the higher frequencies (and the technology is available), than the rules allow him to try it. But, the FCC also thought it was a good idea to point out, in the exam, that he might be frying his eyeballs (and everything else) if he does not do it safely.

In other words, given the possible capabilities at our disposal, the exam and license serves a serious purpose.

Run any kind of power through a mag mount antenna and you stand a very good chance of burning the hell out of you're paint.
I just today took delivery of my new pickup,and because I was trading in my old one I stripped all the radio gear out of it last night.As it happens the Wilson 5000 mag mount was the last to come off,and it didn't come of very easy either.The paint looked like hell (thank god it's gone)
One thing I forgot to do was check underneath the mount and see what the foil looks like.Paint cooking aside I have been very pleased with the 5000's performance.
It's time to move on though,I just sent an e-mail to *55* about a longer masted open coil antenna.I'll have to wait and see what he says

Yes , if you want ALL the modes. I have been thinking of getting one just to finish designing the AM mod. I was almost there when I was side tracked by other things. AM tx is easy to get on one. I had thought them to have a sensitivity problem on AM. I dont really think so now. I think I made the mistake of comparing the sensitivity of SSB to AM. My Icom and HR2600 both seem to lose a lot of sensitivity when I go to AM just like the HTX-100. If I am right about the sensitivity issue putting the rx on AM is no big deal either.

Ok. I understand your stated position on the export radios and you are certainly entitled to your opinion. But isn't that a little like suing the gun manufacturers and tobacco companies, for lack of a better analogy? It isn't the product, it is the people who buy these products and what they do with them. Which in turn would lead us back to enforcement issues. If the feds were to take cb ops to task for violation, going after safety infractions, interference, dirty equipment, splatter, I would have no problem supporting that. There is enough spectrum out there to accomodate most radio ops. Even the keydowns and competitions, can be assigned space where noone would be affected. But splatter sometimes cannot be avoided. Conditions dictate that even barefoot ops across the country sometimes can bleed you a channel or two away.

Source record: 52299

Hello Landshark: Oh yeah..... it took 104 1/2 MPH winds while mounted in the back of my pick up truck, hauling ass down one the highways here in the Mojave Desert. The film didn't come out on that one so we are going to do it again with a video camera, and still camera for the web site. The chase car was a new Ford Mustang that had plenty of gettie up and go, but the pick-up truck just wasn't made for full out race, and high speed antenna testing.

The antenna was really blown over but didn't have any damage, and is now installed on top of my garage roof.

We wanted to get to 125 MPH, but my Ford F250 just didn't make it that fast. And we was running out of free unobstructed road in a mile or two. Looking for a Hy-po big block pick up truck for the 125 MPH run. Boy I sure wish we wouldn't have screwed up the film that day.

We didn't see any California Highway Patrol, that day either, I am sure they would had a field day writtin up that one. "What you red necks doin now, and out of the truck Boy!"

Andrew,
I wouldn't worry about it too much, there really won't be much
difference between your mounting locations. I think it will depend
more on where ~you~ want to mount it. There's some difference in
radiation pattern according to where the antenna is mounted, but not
enough to matter. If you only drove in one direction all the time,
I might worry about it. But you don't do that, do you...

hey , i drive big truck up and down I-5 in northern cal and sat night about 8 pm i was bored and scanning on LSB and all the channels had alot of traffic once the mexican stations quit covering everyone up. ch 37 had a very strong signal so i clarified and its hitting me about 8 db . the operater is 308 out of australia!!! so i kick my amp up { running a 148ltd with a 150 silver streak and a 5 ft wilson silverload all matched but nothing really big} and actually made contact with him! the conditions on that night must have been just right and lasted only 10-15 min for that contact. so i finish with him and a station in NZ hits me a little weaker and i can hear him talking to so cal, then fresno and ha its my turn. lost him real quick. so on and on until about 930pm or so then it all went away. i forgot how much fun this stuff can be!
anyway just wanted to share that with you all.
BTW is it normal for a cobra to recieve better than a dx88 around a electronic engine{cummins} ?
i really fell back in love with my 148 again. i just cant hear myself :}

Smart.
Get the guy to not only break the law but get shot while doing it. Judging by his post he seems unlikely to be the type of person who would do something so silly.

Besides, all he really has to do is find out what freq. the guy likes to TX on then go to Radio Shack, buy a cheap walkie-talkie, put it on that freq., tape the TX PTT switch closed and lob it up on the roof under the antenna, or at least in the bushes near the antenna. Plug his ears good. It doesn't even have to be on the same freq, just close. ;-)

Another thing you might try is hitting www.radioshack.com and doing a
search for crystal or xtal. You might even be able to order the
doggone thing right there from the comfort of your computer chair!

Just a thought

Hey Scott, it's funny, but I get the idea you dislike hams. LOL.

You say you've been on the air 30 years. Me too. Then how come I have totally different experiences than you do? Reading your post about knowing hams through 'real world contact', I can echo the same sentiment. But your first reaction is to say I have a closed mind. Maybe you ought to examine your own blinders.I'm not trying to bullshit you, this is really what I've experienced: the majority of hams I've run into in 31 years are not rebellious lawbreakers, cheats, and liars. Neither do they go around pompously quoting rules, (as some would have you believe).

And no, I never claimed that there are no CB/hams or that hams who hang out in rec.radio.cb are here "for info only". There are quite a few hams in here who are into CB linears and/or freebanding. It figures they will hang out in rec.radio.cb.

But if you hang out mostly in rec.radio.cb, just about the only hams you'll meet are the ones who are into CB linears and freebanding.

I don't think you can form a judgement about the majority of hams on that basis.

<< In article <20000917003920.16743.00000047@ng-bh1.aol.com>, x34956171135@aol.com (X34956171135) wrote:

And per statistics the average American household has 2.5 Children. That would make you the 1/2 person in your family. Sorry, you have a one track mind that is not open to other veiw points. I live in the real world and have been in radio while you still watched scooby dooby dooo. What you need to do is spend more time on the air and less time telling this NG how many truckers you heard on 10 meters today. You know ham radio through books and magazines. I know ham through real world contact with fellow hams for over 30 years. Go ahead a kid yourself that all the hams down on this NG are here just to gather information. If in doubt, see the ones that post their call signs and search back through old posts and see what they talk about (Linears,Exports,Pills,Mods,Modulators,etc.).
I have no problem with hams on this news group, but I don't lie to myself why they are here. If you had real world experience you would know that

some of the best CB mods are being done by licensed hams, for CBers, for the all mighty dollar! Who do you think is doing it..Radio Shack? As for your complaints about truckers on 10 meters...try some other HF bands and quit the bitchen or get a job at the FCC and do something about it. I'm sure that freebanding will stop because you came to this NG and pitched a bitch. Remember what I said? Radio is suppose to be fun..so get on the air and have fun with it! Or get another hobby...SEE YA

--
THANK YOU: Scott!

You know, life sucks so much that I don't blame people for wanting drugs to make life bearable.
On the other hand, the only radio operators I hear doing drug smuggling is mexicans and columbians
at night on the shortwave bands.

How do we know that these individuals are of Souther European heritage? I was under the impression that these messages were CW. Does his fist have an accent? LOL

I work on PC-122's and similar radios. For information on your
chassis, look for Grant XL/Cobra 148 Mods. You should have an
MB8719 or an RCI8719 in that radio. You can search Deja.com for
that info and there are many web sites that contain modification
info. Good luck. Try asking "JamesBond 007".

5861. AM FM Radio Interference

Newsgroup: rec.radio.cb
Date: 2000-09-17 00:00:00 UTC
From: Francisco Hernandez <xy0xy0@earthlink.net>
Message-ID: <m29x5.2843$nk3.192727@newsread03.prod.itd.earthlink.net>
Source record: 52410

Hi,

My next door neighbor has some type of radio/ham system.. but causes interference to our receiving of radio signals (am/fm), Id like to know if there is anything I could do to stop the interference because of it we cant listen to radio (am/fm)
I am unsure of what kind of system he's using.. or the type.. he has a large antenna going straight up from his garage, I've tried speaking to him but he refuses to try and cooperate to resolve this issue, if I cannot do anything to stop this interference is there any kind of legal authority I could be able to contact for help?

Any help is greatly appreciated.

If, after you've tried talking with him and working out some kind of an arrangement to reduce or eliminate the problem, he still refuses to attempt to fix the problem, you should then try to contact the police about his "distrubing the peace". If the police refuse to act on it, you should then contact the FCC at http://www.fcc.gov/eb/Public_Notices/heee1.html or fccinfo@fcc.gov or 1-888-CALL FCC. Be sure to follow all the steps in their complaint process to the letter.

If after some time nothing is done by the FCC, you're probably out of luck, legally... it's time to consider other methods. Be advised I am not condoning clipping or pinning someone's coax, pulling down their antenna, or any other such actions.

well i have yet to test it for myself , but i always heard that a leece neville will only put out a certain amount of maximum volts, so i don't understand how smaller pulleys will change the equation. are you running 500 volts on the screen as recommended in the eimac book? on the grid voltage, what is the determining factor on the size of the negative bias? is it the amount you want to drive it with coupled with classification? i am still chewing on this and reading on it, and it will be only a matter of time before i figure it out. perhaps theoretically it can be determined by formulae. i think the use of contactors is a good idea, but i think i will run twin systems thereby negating the need for them , i got the room and the juice. still chewing on how to turn this bug a boo on and off and make sure it is off and other saftey considerations such as possible ground fault problems. as you know, it will take just one time and that is the end of life as i know it,.....cd is out.....

Sent via Deja.com http://www.deja.com/
Before you buy.

D109 is the limiter component. Do not disturb D110.

Peak: L104 and L107

If adding the variable power circuit, remove the red wire going from point "A" near the modulation transformer to point "A" near the final. The transformer side provides the source of carrier current that goes to the driver/final collector junction at the final side of the wire.

Also if adding the variable power mod, disabling the limiter is not necessary and don't use a power Mic (If you want the audio quality to be natural sounding).

Looks to be the same basic board as the TRC-443.

The link below will take you to the CBTricks file area. There you will find trc433.jpg and TRC433.txt which outline varipower for this board.

Also varipwr.pdf and Varipwr.txt for the schematic and description.

http://www.egroups.com/files/cbtricks/

Hope this fills in some gaps.

No, every state does NOT have laws giving local cops jurisdiction over
RADIO. Indiana appears to be the first. (V&T regulations on police
scanners are not the same thing.)

Read the instruction manual to your am/fm radio and you will find a disclaimer/warning that it is a Part 15 device which must not generate any harmful interference to any other service but must tolerate interference from other services. To cut the legalese, if your neighbor is operating a CB or amateur station and is operating within the limits of the law regarding frequencies used, clarity of signal, power output, etc., then the problem is not with your neighbor but with your radio. From that point, you need to contact the manufacturer of the radio, because by definition, it is not operating properly.

Don't bother the police. They have no authority to cite your neighbor for disturbing the peace or anything else. This isn't a law class, but it has already been litigated and the case law defines disturbing the peace (in this situation) as something like your neighbor having a massive stereo system that you can't avoid. You can avoid your neighbor's radio signal by turning off your receiver. You might be inconvenienced by this, but if your neighbor is operating legally, it isn't his problem that you have a defective radio.

Hassling the guy isn't worth it. Go to Radio Shack or some other place and ask for some filters. They'll know what your talking about after you explain the problem (hopefully the Radio Shack Sales person too!). Not very expensive and it'll save you grief. Also, now you know what kind of an asshole you live next door to. Think of it as a learning experience.

If the neighbor's radio station is legal, then the problem is with the am/fm receiving radio, and toroids and capacitors might help, but the manufacturer needs to be contacted first for their recommendation.

Seriously Bubba, why do you care what other people read about?? No need to get all anal-retentive about it. Do me a big favor and assume more stuff about me, it makes you look even sillier than than your original post..didnt take you long to come up with that 1/2 baked response..
And just for a bonus clue Bubba, i dont have a linear in my truck, and if i did, leaving it on will take a long time to drain a battery.(If you really are a ham, which i doubt now, you would not have said something as dumb as that). Im gonna sit back and watch you troll some more there Bubba. Dont strain yourself too much doing it

aw heck , i thought the most you could see out of those things
unregulated was about 20 volts or so, oh well, learn something new
every day. hmmmmm, kind of makes you wonder if a primary designed to
take 11 - 15 and a secondary of about 1500 to 2000 volts dc, then what
will that much on the primary give you ?,.......cd is out......

You should note, that because your radio is classified as a "part 15" device, it has to accept any interference it receives. Therefor, unless you can prove he's running illegal amounts of power, he has no responsibily to fix the problem or help you fix the problem. Here's some ideas though:

1. Go to radio shack and see if they have some filters you can use on the radio
2. Get a new radio (does it just effect this radio or every radio you have? If it's every radio, I'd say you'd want to contact the FCC - it's very unlikely that it's "your problem" if it's affecting more then one radio)
3. (not that I think this is ethical or anything, but it's obvious this guy is complete jerk, and if nothing else works) Find a pair of wire snippers and a knife. When it's really dark out, go to his house and find a black wire that's running up to the antenna. Cut the wire in half. Take the knife, use it to remove the outer plastic coating from the cable, now you'll see a metal "braid like material". Fold that back out of the way. Now use the knife to remove the 2nd layer of white plastic material. Now there'll be a wire sticking out of the middle of that. Take the braid, and make sure it's touching the wire very firmly. :) He won't be transmitting again for awhile :)

So would I. Unless I missed something, Kingston, NY is the only TOWN in the country that enacted ordinances and laws STRICTLY for cb. To date, no state has enacted similar legislation.

5886. Re: N9VKS: Indiana ham arrested for having a scanner

I'm a little bit confused about the following post. If the Communications Act of 1934 created the FCC and gave it exclusive powers to regulate radio, how can a state decide on its own to enforce FCC regulations? My impression has been that they can't without Congressional action. This, I understood, was the reason for the House Bill of a couple years ago that was to give such authority. However, it failed. So if it is OK for states to enforce FCC rules, why was that initiative necessary? It would seem that Indiana is looking for some constitutional troubles if they were to pursue this. Are they suffering from paranoia? Here in NC, I know of NO statutes against scanners in vehicles, nor anyone hassled just because they have an antenna on their car.

Thanks for yout time!

I forgot to mention that this interference only affects the radios in the garage.. (my neighbors garage is next to mine) not radios inside the living room, ive tried 2 cdplays, and 2 radios on the same set of speakers.. plus one self-contained portable stereo unit.. those are all affected.. those units were the only ones I tried
ill stop by radio shack and see what i can find for filters and ill approach my neighbor again.. then ill see what happens..

thanks again

Check the grounding on your outlets if it only occurs on
one branch.

That's different

If it's affecting only radios in your garage, and your garage is right
next to his, then you're in the near field, and there's nothing you
can do about it.

Daniel,
You started out giving good advice till you got to #3. From
there,
you've changed from giving good advice, to getting the man in trouble.
Everyone's making the assumption that the neighbor is a 'jerk'. I
think Francisco needs to talk to the neighbor before doing anything
very drastic. He may not know that anyone has a problem (encluding
him
self).
Since the radios inside the house do not seem to be affected (only
the things in the garage), I would suspect some difference in wiring
in
the garage. That's something to consider. Or, it could just be
because
of proximity also.
The best thing to do is request the Interference Handbook from the
FCC, and findout exactly what each party is responsible for. Makes a
'hell of a lot' more sense than 'pinning' some one's coax.
'Doc

Hello Brian: I wonder why it is that you never stand up for the CB
type of guys. You always seem to agree with the hams and others. Kind of
a brown nosing effect.

I love it when you reply with one of the guys you brown nose up to and
just say: "I agree" or "Right on" because you don't want to walked by
the facts. Or you think the guys right. Stands out like a big ol sore
thumb.

Whaaats up with dat?

Any law enforcement officer can make an arrest for violations of
federal laws and regulations (assuming the regulation allows for arrest
of violators). It is then up to the federal government to seek a
conviction of that person in the courts.

In the past, the federal government often failed to seek convictions,
so the house bill was an attempt to give direct enforcement of federal
regulations concerning radio, without federal involvement, to local law
enforcement. That bill was defeated.

The key between the two is the level of federal involvement. Under
the present system, there is a requirement for federal involvement.
Under the failed house bill, there would have been no need for federal involvement.

I know, that probably wasn't very smart. Everyone assumes he was a jerk because he wouldn't talk about the problem. And now that we know the interference is only in the garage I'd also recommend this:
1. Try pluging the radio into an extension cord, that's pluged into an outlet in the house. See if that helps (if it does, you have bad ground in the garage)
2. Do the same thing as #1, but start at the house, and walk to the garage. Determine exactly where you start to get RFI (and if it just comes on suddenly or if it gradually comes across the radio). Tell us what happens.

5898. Ground Plane Question

Newsgroup: rec.radio.cb
Date: 2000-09-17 00:00:00 UTC
From: Andrew <akocsar@smartt.com>
Message-ID: <8q3ve5$3i0$1@newsfeed.smartt.com>
Source record: 52447

I would like to install an antenna on a pick up truck and have the following questions. I was considering a box stake hole type mount and was wondering if this would work less or equally well as say a hood / fender lip mount. I guess the question would be, is a large flat expanse of metal (the hood) at the base of the antenna a better ground plane than a narrow strip like the top of the box rail even though the box in total is a larger area. I'd even listen to theory on this one.

Any comments on the fire-stik antennas would also be appreciated.
Thanks,
Andrew

And per statistics the average American household has 2.5 Children. That
would make you the 1/2 person in your family. Sorry, you have a one track
mind that is not open to other veiw points. I live in the real world and
have been in radio while you still watched scooby dooby dooo. What you
need to do is spend more time on the air and less time telling this NG
how many truckers you heard on 10 meters today. You know ham radio
through books and magazines. I know ham through real world contact with
fellow hams for over 30 years. Go ahead a kid yourself that all the hams
down on this NG are here just to gather information. If in doubt, see
the ones that post their call signs and search back through old posts and
see what they talk about (Linears,Exports,Pills,Mods,Modulators,etc.).
I have no problem with hams on this news group, but I don't lie to myself
why they are here. If you had real world experience you would know that
some of the best CB mods are being done by licensed hams, for CBers, for
the all mighty dollar! Who do you think is doing it..Radio Shack? As
for your complaints about truckers on 10 meters...try some other HF bands
and quit the bitchen or get a job at the FCC and do something about it.
I'm sure that freebanding will stop because you came to this NG and
pitched a bitch. Remember what I said? Radio is suppose to be fun..so
get on the air and have fun with it! Or get another hobby...SEE YA

Here is a copy of my original post in case you still don't get it! As
you can see, I am defending CBers against what I see is an unfair
attitude of many hams! I don't see how anyone gets "Whining about CBers
out of this".

I have always been amazed how ham radio operators always put themselves
above the law. For example: the majority of ham sites have a section
they call mods. These modifications cause out of band transmit
(freebanding!) and just because you call it a mars mod-it may still be
illegal. I have known hams for years (I am one!)
and I am amazed how ham operators modify their radios (mars mod!) as
soon as they buy it. Yes, ham radio
operators do modify there radios (example: UHF radio-mars mod- now used
to talk on FRS radio freqs. and higher
than legal output) Also, hams flip switches and cut diodes to make
there HF radio all band transmit and talk on so
called freeband freqs. everyday. Ham radio operators seem to think that
holding a ham license somehow gives them
more rights to violate FCC regulations-IT DOES NOT! If anything, those
that have ham licenses should set the
standard and live to a higher code than do 11 meter freebanders. I am
always amazed how those hams that violate the
law look down at CBers and try to tell those operators that THEY are
violating the law. Trust when I say, that if you
go to Ebay and bid on a radio such as a Yeasu FT-100 being sold by a
licensed ham operator, 9 times out of ten it has
all ready been modified for out of band transmit. WHY? Is that not
illegal? Why did he see fit to make this mod?
The answer from a ham is for emergency only operation! Well I am glad
that when the world is coming to an end, we
have all these ham operators ready to rock with their illegal radios!
Come on fellow hams, give CBers a break until
you stop the mars mods and follow the letter of the law yourselves.
I know CBers with better
equipment and better operating proceedures than do some fellow hams. I
like CBers who run clean equipment, stay
off the ham bands and operate in a professional manner. There are
people on this NG that have more tech. knowledge
than many hams. I like to read this NG and myself have picked up on
some good tech. info. But, fellow hams, take a
look around your own radio room and justify the illegal mods you have
made to your radios. You can't, you won't, end

of story!!!!

5902. 11.000 mhz synthesizer crystal need for Courier

Newsgroup: rec.radio.cb
Date: 2000-09-17 00:00:00 UTC
From: vfo1@juno.com
Message-ID: <39c4845d.2281061@news-server>
Source record: 52461

Hi,

I am in need of a 11.000 mhz synthesizer crystal for a Courier Centurian SSB base. Somebody removed it and installed one that is 11.400. I want to get get it back to the correct one. Please e-mail me if you have one.

Thanks in advance,

Bill

Radio Shack carries crystals of just about any frequency. You might
have to order it thru them at the store, but at least you can get one
there.

well chuckie, he's right. this isn't the place for that. but it seemed quick and easy at the time... and I think he took up more bandspace complaining about it that I did with the original post. surely there are better things to discuss here.
I'm trying to figure out where I can buy the new Superstar Base units. (wholesale) I havn't had any flyers on them yet.

you would be far ahead to get one of the new state of the art units..
the old Trams are classics and in a class by thier self....but most of
them have a few problems in them by now and are hard to work on for
some of the new tech's. the moonrakers are still on the market new..

the 87a will do 2500 pep no problem and there are a lot of the henry's running more then that on the band. have you a nice listen to the california guys on 14.295 they are all running those big amps you say cost more than a car. remeber not everybody is on a tight budget. these guys with huge antenna farms and four or five multi thousand dollar radios can sure afford that big amp too. a ham ticket does not automatically make a person better, there no more likely to follow the rules then a cb'er is the break the rules. were all people witht he same down falls and the same desires. people get there ham license and start feeling all high and mighty, if a ticket does that to them i bet they were unbearable when they first got there drivers license as a kid

>
>> So you are saying that an 87a will do 2.5 kw and a Henry will do 3 kw?

good for you jerry. the same night i was on 11 meters having about 15 qso's with australia, new zealend, and new caledonia. even had a short one to doug down on lord howe island. ten is never as active as 11. on days where there is superp dx levels there will be some dx working on 10 but still never like 11. i've heard many many evenings after sunset when the band is wide open to the south pacific and far east with no hams to be heard on 10 at all while were sitting on 11 working the world. guess the hams were off having fun talking to old charlie or whoever down the road on 80 meters.

5920. Re: N9VKS: Indiana ham arrested for having a scanner

Newsgroup: rec.radio.cb
Date: 2000-09-17 00:00:00 UTC
From: 2121d@gte.net
Message-ID: <39c4cab4.3930091@news.gte.net>
Source record: 52479
Cross-posted to: rec.radio.amateur.misc,rec.radio.cb,rec.radio.scanner,rec.radio.shortwave,misc.survivalism

:> Only if there was a law in the US Code or a state law outlawing
:> possession of a ham radio by a non-licensed person. The comparison
:> isn't valid if no such law exists, since there is a law against
:> possession of pot.
:>
:> It's sort of like a person violating a part of the UCMJ while they
:> aren't in the military. The UCMJ only applies to military personnel.
:
:Several participants in this thread have their laws, rules and regulations,
:and levels of authority and jurisdiction mixed up.
:
:CB - no individual or station license required, but technical regulations
:are still in force and apply to anyone within the FCC's area of jurisdiction
:(USA and territories).
:
:This means that possession of an external RF power amplifier ("linear" -
:although that is only one kind of amplification and is the main type used
:for AM mode) that is designed or adjusted to work in the CB band is NOT
:PERMITTED FOR ANYONE in the above-mentioned areas. If you are a ham and
:have an 11-meter "footwarmer" and it is tuned to be maximally efficient in
:the 11-meter band, you are in violation. However, if your
:originally-11-meter amplifier is tuned to 10 meters or some other band,
:there is no apparent violation for a licensed ham operator. (The FCC might
:still ask for some form of certification or proof that the amplifier cannot
:be operated on 10 meters.)
:
:FCC has authority to regulate radios and their use all over the United
:States and its possessions and territories. It doesn't matter if any
:individual is licensed or not; the regs apply to everyone. If you're
:unlicensed, transmitting is prohibited. If you're licensed, the other
:regulations regarding proper operation and technical specs apply to you.
:
:Local police departments do not have jurisdiction to enforce FCC
:regulations. That is a Federal function, usually carried out by (depending
:on circumstances) the FCC itself, the FBI, and/or the United States
:Marshalls. A knowledgeable police officer may bring your unauthorized radio
:to the FCC or DOJ's attention, but he may not make an arrest or confiscate
:the equipment UNLESS there is a violation of some other statute that is
:within his power to enforce. If the officer knows that much about radio,
:she should also know all about the jurisdictional issues.

My state just gave local police the authority to make arrests for
violations of FCC regulations. Just as local cops can make arrests

for federal drug crimes or illegal aliens, all it takes is to have a
matching state law. Besides, we now have multi jurisdiction units
that are made up of federal, state and local LEOs that can arrest
for any crime.

:In the case of an 11 meter amplifier, a local officer could charge you with
:a relevant motor vehicle equipment violation if such regulation exists. If
:your radio transmissions are causing interference with audio or radio
:equipment belonging to someone else, you could be charged with some sort of
:"disturbing the peace" or "disorderly conduct" offense. Naturally, if you
:fail to cooperate fully with the officer to the extent required by law under
:the circumstances of your encounter, you can be charged with disorderly
:conduct or even some form of obstruction of justice regardless of
:jurisdiction on any radio issues.
:
:So, in short, while the police do not have jurisdiction over your CB radio,
:it will not be productive to rub their noses in the fact.

even at the very bottom of the cycle around 1996 i was still able to talk to my friends in south america and practice my spanish but even better it gave me the chance to work locals around 50 or so miles from me that i couldnt hear before. for a person to have any longevity in this radio hobby you have to be versatile. the dx will always return.

>
>Only when the sunspot cycle is high you will make those rare long dx

I also am a ham and i agree with Scott. also be aware that just because some one is a ham don't meen there honest. i have been burned by more than one ham. if a ham tells you that he is not sure if something works because he just hasn't had the time to check it out. thats bull. hams always check it out then if they can't fix it or it cost to much to fix they sell it. AND THEY SAY JUST DIDN'T HAVE THE TIME TO CHECK IT OUT.

:> :>What concerns me is that we are seeing an increase of people using
:> :>radios, as guns were used before, to commit crimes. Drug runners are
:> :>using scanners and CB radios in chase vehicles to let the mules avoid
:> :>the cops.
:> . That is what
:> they are arresting people for. Using CBs and scanners to avoid
:> detection by the police. Look at this thread. Several people have
:> reported being stopped by the cops for having radios, all because the
:> drug runners are using them.
:
:Please people...those of us here that have experience with both sides of
:the dope trade are just plain laughing right now.
:
:Domestic drug numbers stations based in Indiana
: and using mobiles on CW???

Two seperate issues. The drug runners are using scanners and
out of band CBs in the escort vehicles.

The CW mobile stations are something else. It appears that
individuals of southern European heritage are transmitting some
type of number messages for whatever purpose. Given that there
are a number of Serbians in and around Chicago, who knows. But
hams have seen, and heard, transmissions while on the Indiana Toll
road.

:Hams being arrested or detained???

N9VKS was ticketed for illegal scanner usage
according to Popular Communications in the
Sept issue.

:Drug runners in and around the ham bands???
:
:And the cops in Indiana are stupid enough to believe it???
:
:First off.....
:The Indiana cops probably turned the musings of a tweaker (meth user)
:into a pretty tall tale, after finding a CB in his truck after a search
:and arrest.
:
:Second...
:NO drug cartel worth a 10 spot of crack is going to use CW (smoke
:signals) to move the product around in the states. If they are stupid
:enough to use a ham radio then they must really be amateur.

:
:Third...
:Ham radio operators make crappy drug runners. Do I really have to
:qualify that.

But ham radio would make a good cover for having a scanner if you
were a drug runner. Or involved in some sort of spying.

:Fourth...
:Felix Areallano and his brother can afford to buy encrypted astros from
:Motorola S.A de C.V. with no questions asked if needed.

Therefore the cops would be looking for any type of radio activity.

:> :>And it looks like someone in the Chicago area is using their ham
:> :>license to cover a spying network. Too many in the Gary-South Bend
:> :>-Mishawaka-Elkhart area are hearing mobile ham stations trainsmitting
:> :>number type broadcast, in and around the ham bands.
:
: Sunspots playing tricks.

Not when the car passes you on the toll road and overloads
the front end of your radio.

:
:> I personally saw a guy with ham plates
:> blow by me, jamming the front end of my receiver with
:> a number type mesage in CW on the lower end of 20.
:> Others upstate are reporting the same thing.
:
:Or just another idiot jammer...
:>
:> :>Therefore the cops are looking hard at anyone with a radio.
:
:At the most the cops are dealing with a major meth problem in the
:midwest and some of the tweakers have been arrested and in possession of
:some box with a mic attached...the word spread among the patrol ranks
:that "the tweakers were on CB"(big surpass eh).
:
:When the DEA and FCC start pulling over cars with antennas then you
:MIGHT have something to really worry about.
:
:There are plenty other reasons why this is nothing more than a fantasy
:in it's current form.
:
:I'm not saying that radios are NOT used...but any decent smuggler knows
:the proper use of radio equipment and freq spectrum for any give
:task.
:
:Remember they have a lot more money and resources than the Indiana cops.
:Except for the tweakers...they are poor and stupid.
:

:If you put a "tweakers suck" bumper sticker on you car, they would most
:likely leave you alone.
:
:> :The Cops wouldn't know a numbers station if it was transmitting
:> :in their car!
:
:Yah Huh....they have a special doggie for that.
:
:> There are a number of ISP troopers who are also military intelligence
:> analysts in the Guard or the Reserves. I would expect that they have
:> some exposure to signal intelligence.
:
:They can probably tune in a signal and listen...but the military is not
:really trained real well in drug interdiction, let alone domestic drug
:interdiction. The fact the police have those people on staff does little
:good if the PD does not provide monitoring hours and a shitload of
:equipment.

That is why reserve Intel folks are being put on active duty and
loaned to the DEA and FBI to help the locals. Plus if a cop is also
a member of the Guard or Reserves and is trained as intelligence
analyst then the cops get the best of both worlds. And there are a
number of cops who are 96Bs in the state of Indiana.

As far as the equipment, just hook a AOR8200 into a laptop computer.
Or use an Optoelectronics Scout.

:>
:> :And they have LITTLE authority to do anything about it even if
:> :they find such a station.
:
:And trying to prove it was used to evade cops would be fun also.

No they use it as an excuse to pull you over. Then search the car.
The radios are destroyed if you do not have a license. And you
get a ticket for a class B misdomeanor ($500 fine). Plus whatever
else they find.

:>
:> They can gun you down if you mouth off. It is called resisting
:> arrest.
:
:Jee
:In california the cops just beat you.

The California cops have gunned down their share.
One black woman who was sleeping in her car (I think
it was in Riverside). Then the LAPD was having a contest
to see who could shoot the most gang bangers.

I have never used a call sign here because I don't think it is particularly relevant. It also allows typecasting and slotting to detract from an interesting discussion. Believe me, ending sequential call-signs was the greatest idea in the history of amateur radio. As Baron Munchhausen used to say on the radio, "I vas dere, Sharlie".

But if it is a manhood issue -- strikes me that not hiding behind some silly alias is more of one -- then for the record, I am:

Dick McCollum N0BK ex-P1-17-15936 and aging Boy Wonder.

Source record: 52493

Hello Death By RF: Yes I agree the 279.95 introductory price is steep and quit a few of the people have told me that.

This introductory price of 279.95 is twenty dollars less than the in production and running Jo-Gunn Son of a Gun, Ground Plane Antenna

The aircraft grade high quality materials, machine shop, injection moulding, and stainless steel hardware, purchased in small non production quantities is very expensive. Also all the antennas are hand built by me in my garage, while listing to Rock & Roll Music. (93.1 MHz out of LA)

The Mastodon 5000, and the Mastodon Interceptor 5000 is in a Proto-Type stage status. Meaning that if enough interest is shown, production will start in larger quantities and this will drive the price down significantly.
The Mastodon is a commercial grade antenna, and isn't for everyone. It will work from 24.8 to 33 MHz, simply adjust to where you want it to work at. And I feel very confident it would stand the nasty weather conditions on a mountain top repeater site, say for 10 meter FM operation.

>>"almost $300.00 for a 5/8 vertical is highway robbery"<<

I'll half to disagree with this statement. Look at the new antennas that out there. A good example is the Hustler 2 meter model G7-144 (its 14 or 15 feet tall) it goes for $180 dollars and doesn't use half the material I use in the Mastodon Antennas. Also look at the going prices of the other type of antennas that almost use the same amount of material that I use, like in the all band verticals for the ham bands, the prices start around $279 to around $400 dollars and more. And again these are current in production antennas.

The days of having a good high quality Ground Plane Antenna, that has great performance and low or no TVI interference problems for around $49.99 are gone.

Look at whats available today, and make a comparison of the quality, materials, and performance.

All the Mastodon 5000 antennas out there (about ten of them) haven't put one cent into my pocket at this date. Most are still being tested for Reduced TVI Interference, Performance, Power handling capability, and assembly instruction verification. The testing continues, and feedback is pretty good. It will be able to be read in a web site soon to be put up.

If you can come up with a better antenna that has a significantly reduced TVI interference, that can take 10KW (tested for 15 minuets straight), can be tuned from 24.8 to 33 MHz, and out shines all the others on the market today, I'll buy it in a heart beat.

Jay in the Great Mojave Desert.

PS: Wait till the beams come out.

Hello Sideband (SSB): Yes good point!

I was talking with the local Radio Shack guy, while I was in the city.
He showed me a very large book, with all kinds of radio stuff you can
order from them to save you a trip into the "BIG City"

If ya goes into one of them Radio Shack, make the sale dude show ya the
big book from which to order stuff from.

<< What we would like to think does not happen by
those who are licensed, does not change the fact that mods are being
done, hams talk on 11 meters and freebands with moded ham radios,
handhelds are mars-moded and used on FRS freqs. If you know no one that
is into this side of ham, then you need to get out a little more often!>>

Scott: You must admit that if a ham spends most of his time trying to get more
watts out of stock CB's, modding export radios to work on 11 meters, and
evaluating the merits of davemade vs. noname CB amps, then they're not exactly
a typical ham.

I am a Ham! The reason Hams are at this NG is for the same reasons that CBers go to Ham groups. CBers go to Ham groups for tech info, mods and radio purchases. Hams go to CB groups to buy and to sell not so legal equipment (if you have noticed-some of the best tech heads on exports and amps on this NG are also on Ham news groups with call signs) and to further their interest in CB and freebanding. Thank God there is one honest Ham among us. Watch..Now here comes all the excuses and 1/2 baked responses....

THE AMISH GIRL

An Amish woman and her daughter were riding in an old buggy one cold, blustery January day. The daughter said to the mother, "My hands are freezing cold." The mother replied, "Put your hands between your legs.
The body heat will warm them up."

So the daughter did, and her hands warmed up. The next day, the daughter was riding with her boyfriend, and he said, "My hands are freezing cold." The daughter replied, "Put them between my legs, they'll warm up." The next day, the boyfriend was again driving in the buggy with the Daughter. He said, "My nose is freezing cold." The daughter replied, "Put it between my legs. It will warm up." He did, and his nose warmed up.

The next day, the boyfriend was once again driving with the daughter and he said, "My penis is frozen solid." The next day, the daughter is driving in the buggy with her mother, and she says to her mother, "Have you ever heard of a penis?" The slightly concerned mother says, "Sure, why do you ask?"

The daughter replies, "Well, they make one hell of a mess when they defrost.

Doc: ABSOLUTELY NOTHING, and that is the whole point! It is just that some of my fellow hams scold the CBer while partaking in the same or similar activities. I know both hobbies and enjoy both. I was amazed how many hams responded to my other posts. Sure a lot of hams down here for a NG involved in high power CB and freebanding. I forgot, since we hams have an official FCC license we can break any laws we want. You CBers better watch your step though, because we are the grand "rule makers" and "rule breakers"! 10-4444444444444

P.S. I'll be back after I go talk some skip on 11 meters with my brand new Yeasu Ham Radidio.

> a typical ham.

Now this is the type of civil discussion I like to have! In reply:
There is no typical ham of CBer. Never has and never will be! My
interest in radio started in the late 60's in CB (license and all).
I obeyed all the rules (In fact I was real red neck about anything that
broke the official FCC rules). Then it happened in CB. We heard DX
rolling in and gave em a shout. Pushed our antennas up past legal
limits. Found a thing called a "Black Tube" to put in our tube type
radios to add a watt or 3. And then along came the business band linear
that "just happened" to work on 11 meters. And believe it or not I WAS
THE AVERAGE CBer in those days.

Let me explain to you why CB will not die and why CBers do what they do
(and why you even find many hams doing it). CB is the wild-wild-west of
radio. That is what makes it fun. Is that not what hobby radio is
suppose to be-FUN?

The reason I get upset with fellow hams is that group all CBers in a
lump. Here are some simple truths: Do most CBers run power over 4 watts?
YES! Do most CBers run a KW? NO! Do most CBers freeband? YES! Do most
CBers talk on Ham Bands? NO! Do some Hams freeband? YES! Do some Hams
mod radios with illegal intent? YES! Do Hams talk on CB band with modded
Ham radios? Very Yes! Have Hams always put themselves above CBers and
sometimes even above the law? YES!

Next time you hear truck drivers on 10 meters, don't blame all CBers!
Truck drivers have always been the wildest in the wild-wild-west. They
are not what you would call the average CBer.

Trust me when I say that there is things on this NG that scares the hell
out of me! Things such as "Negative Compression Mods" and "Competition"
class C linears. There is a trend right now towards this nasty, dirty RF
creating crap. I come from the old school of keep your RF clean and
conservative.

I hope you will take a moment to open your mind to a different way of
thinking about CB and CBers. We hams have our own sins to worry about!
Lets have honest conversations with CBers. I love the wild-wild-west of
radio that is called CB, and I love ham radio too. The first place to be

honest is for hams to tell the truth about why they hang around this NG.
Do ya know what I mean????

That statement was a joke! I was referring to Hams that talk on CB bands using their All band tx modded ham radios and then scold CBers for doing the same! Hams are much to serious. I bet a CBer would have understood the joke!

P.S. I talk CB mobile using a legal 40 channel Cobra radio. None of my ham equipment has been modded in any way. You are missing the point of what I am trying to say. It is not illegal CB I condone. I just don't like the ham radio operators " I'm better than you are attitude".

Well I guess you are right! Hams need to know more about Texas Star
linears, roger beeps, noise toys and echo mikes! I have all these hooked
up to my Yeasu! I other words: Lame..Lame..Lame! I suppose all your
radios are box stock and unmodded too..eh? Don't forget to turn the
linear off tonight in your truck so you don't run da battery down!

<<There is no typical ham or CBer. Never has and never will be! >>

Well Scott, I can't speak for CBers, but there IS a typical ham, as determined by polls and statistical data. He is between 38 and 55 years of age. His average power is 100 watts using a barefoot transceiver. His antenna height is around 40 feet. His favorite band is 20 meters. His favorite modes are phone and CW. (Source: QRZ.com, FCC database, QST polls)

The vast majority of hams I've talked to over the years have fit this profile, and to my knowledge, they didn't seem particularly obsessed with "putting themselves above CBers", and not many seemed particularly anxious to get on 11 meters and operate "above the law" either.

No but I got the 23 channel ssb 100. Been a few years sense I powered mine up but it worked great for me. Also have the Lafayette 23 channel Dyna-com hand held. I need to find a finel with the marking F-8 on it. It too was a great CB when it worked.

You make a good point Tim. To some extent, there is some ham politics involved in this. Ten is legal for Tech Pluses in the 28.3 to 28.5 range which is the favored area for DX. Since this was done, the DX stations got tired of working newbies and the Tech Pluses became Generals either instantly or with little effort after 15 April. The net result was desertion of 10 in favor of lower bands. CW ops gave it up years ago. Unfortunately, the freebanding will probably prevent a comeback.

This is really kind of silly on the part of the Amateur community because when the propagation gods allow it, the power required over a path goes down with frequency. In the great 1958 sunspot cycle it was not unusual to have 100 countries over a weekend with a rig powered by two D cells, on 6 meters it took a resonant Zippo. Shortwave broadcasters learned the truth of the relationship eons ago and are generally eager to follow the sunspots onto higher freqs.

Wish you weren't right but you are.

Dick

Source record: 52339

I have a Cobra 29 LTD Classic that's been peaked and tweaked, echo board installed and variable talk back. The only problem it has is one of the led's for the channel display is funky and doesn't light up. Other than that, the radio performs flawlessly. It's currently installed in my car so you'd be able to check it out if so desired. I'm asking 50 bucks for this radio and will travel half way to deliver in the Twin Cities. I live in northern Anoka county.
If interested you can email me at swtempo@yahoo.com

Sounds like the price is not out of line considering the materials. In the early 70's I remember paying $54.00 for my Hy-Gain Penetrator 500 and that was hard to scrape up back then. The Penetrator is still up and working well after all this time. If the Mastodon thing is made in So. Cal I would like to take a look at one.

5980. Feed back problem on GrantXL/148gtl??

Newsgroup: rec.radio.cb
Date: 2000-09-18 00:00:00 UTC
From: oneqck76ta@aol.comSpAmSuX
Message-ID: <20000918120845.07499.00000400@ng-fg1.aol.com>
Source record: 52344

I was wondering, I had a connex Echo board installed in my Grant XL and it made this terible HUM, not a squeel but a hum. the tech that put it in was able to eleminate the hum but I can't turn my mic gain past 2:00. Also, I installed one in my 148 and the same thing but this hum will not go away unless the mic gain is preaty mutch all the way off. I was told that 148's and grant's are famous for this. I have installed number of echo bordes in 4pin (cobra 25's, 29's, Uniden Pc76's and so on) and never had any problems with feed back. They all have talkback but very very quiet.(You have to yell into the mic to really hear it good. Just to adjust echo levels). I have even trien disabling the talkback with no luck. Anyone know how to stop this? Even when I tried to put an echo mic and just an aftermarket (Except for my astatic) mic they all do the same hum. Is there some circut in these radios that cause this problem. Any input would be great. Thanks in advance.

I find ignoring the profanity and/or switching the channel is way more effective than attempting to point out the error of one's ways.

Hello Scott: Yeah will maybe we'll hook the antenna up to the truck radio and shoot skip the next time we do it. I'll give ya ah call on 38 LSB.

What I need is a solid excuse for the Highway Patrol that will cut us loose if we get caught. Like: "We didn't do it" or "Where just CB'ers out running loose, without adult supervision"!

I am open to suggestions.....

Well, one reason I am selling out of my amateur radio is that people won't talk to you. When I got into Amateur Radio, I learned CW, because I wanted to operate phone on 10 meters.(How stupid is that....you have to learn CW to operate phone) I hoped that it would be fun. I found out that many people won't return your call or talk to you if they don't know you. I don't find ham radio operators to be very friendly, especially to newcomers. I stayed around the CB band, because people there were friendly, and I actually got to *talk* once in a while. The problem with CB, though, is all the hillbilly trash talk and illegal garbage, so I pretty much have given up on the radio hobby in general. I sold off nearly all of my radios.

Speaking for a few hammies around these parts, many cbers turned
hammies get bored with the hammie freqs and return to the others where
they began because they miss the agressive style, nature, and traffic
that they were used to.

JR, they do it because they can and they can act like idiots on the cb bands without much recourse. It is not accepted behaviour on the ham bands. i am a ham for 22 years i don't free band, but i do run a fair amount of wattage on the cb band, i don't do this on the ham bands because i respect the bands and those that are on but the cb band is like being able to drive down a road at 90 miles an hour with no cops in sight. Why would you need to freeband if you are a ham

CB Radio was never intended to be an "enjoyable family hobby".

And also, because of the particular part of the spectrum which it
occupies, it has not been, is not now and never will be a short-
distance voice communications service either.

Read Part 95:
(excerpt)

The Citizens Band Radio Service (CB) is a private, two-way,
short-distance voice communications service for personal or
business activities. The CB Radio Service may also be used
for voice paging.

CB Radio was not conceived as a "hobby"!

Analog delays leak their sample frequency and when coupled with a
radio with too much audio gain, you hear a muffled tone. Try putting
a resistor in the audio out wire, or turning back the radio (gasp!).

I agree, try adding a resistor to the audio wire. Also, make sure that absolutely no parts are clipped or removed. There is a hum waiting to happen in a Grant with removed or clipped parts.

Source record: 52510

Hello Jeff: Some of the old now out of business antenna manufactures, use to say to connect the ground wire to the mounting U-Bolts on the antenna, and run the wire down the mast. I prefer to connect to the bottom of the mast, and then run the wire to a ground rod. Having the coax go thru a double female (bullet) SO-239 connector, at the base of the mast, so that the ground wire can also be connected to the coax outer shield wire is a good call also.

I have seen lightning arresters installed on a metal bracket or plate just outside a window. The lightning arrester has another ground wire connected to it, and going to its own ground rod. And the operator just dis-connects the radio side PL-259 connector at the out side mounted lightning arrester. This keeps all the lightning energy outside, and does not allow the lightning energy to enter the house, during a lightning storm.

Jay in the Mojave

Anyone know where I can get a co-phase harness other than Copper Electronics?

I just tried to order for the first time with them, and was met with the rudest woman I think I've ever run into when mail ordering. I got the impression Copper is using some ordering service. If they are, they might better consider finding another company to contract their order taking. This woman chewed/snapped gum, didn't say "May I help you", but "What do you want...?" Acted like I was a big-ass bother to her. I finally said..."I changed my mind" and hung up.

Anyway...I'm looking for a 9 foot co-phase harness. Any help would be greatly appreciated.

6001. Re: Ground Plane Question

Newsgroup: rec.radio.cb
Date: 2000-09-18 00:00:00 UTC
From: "Express Electronics Inc." <exports@exportradios.com>
Message-ID: <Gktx5.350$UN4.32838@nnrp1.sbc.net>
Source record: 52515

Before I started working for our internet company, I was the lead installer at our retail shop in Texas. First off, it really depends on the make of truck. Ford(although I love them) and Dodge are the worst for having poor grounds; especially on the bed. On a few occasions where the customer insisted on the antenna being mounted on the bed, I spent many hours trying every trick in the book. Sometimes the SWR's came down, but often they didn't. I have found that a magnet mount is the best way to go. By placing a magnet mount on the roof, you will have a very good ground and will use the entire truck as a ground plane. I realise that this often is not possible, so my recommendation for bed mounting is to mount it on the driver's side of the bed. Buy a 3-way mirror mount, use only the stud mount side, and screw it into the side of your bed. I also recommend sanding or filing the paint down so you have a metal to metal contact. The Wilson Silver Load will often work better than the Firestik II. The Firestik II will set easier if you have a good ground, though. I hope this information helps.

6002. Radio Frequency Displays and Drift

Newsgroup: rec.radio.cb
Date: 2000-09-18 00:00:00 UTC
From: Richard Smith <rsmith@NOSPAMplaneteer.com>
Message-ID: <fmtx5.6999$YG5.15601@tor-nn1.netcom.ca>
Source record: 52516

Can anybody tell me if radios with a frequency display are accurate ? For example, if an RCI 2950 displays "27.3850", is it actually on 27.3850 or can there be some drift depending upon if the radio is hot or cold or due to manufacturing tolerances ?

I guess what I am asking, is the frequency display actually measured from the signal output and then displayed, or is it just a number that is displayed to indicate what the radio computer thinks the frequency output should be based on what it has told the PLL/VCO (or whatever) to do ?

Thanks,

Richard.

Hello Stephanie,

That seems to be very high for that radio. Have a look through old postings in this newsgroup and on Ebay or Yahoo Auctions etc. for a more "realistic" idea of what the price should be.

Richard.

<< i am a
ham for 22 years i don't free band, but i do run a fair amount of wattage on
the cb band, i don't do this on the ham bands because i respect the bands
and those that are on but the cb band is like being able to drive down a
road at 90 miles an hour with no cops in sight. Why would you need to
freeband if you are a ham
>>

On the one hand I agree with you; there should be a small amount of radio spectrum set aside for people to act like idiots within if they want to. But on the other hand, Hams should know better than to treat CB like "shore leave". Like going to some other town and crapping in the streets to let off steam. You would not want to get your own town dirty but as long as it's someone elses town, that's okay. When you're done playing, you can leave for greener pastures, but the residents have to live there and deal with it.

Neighbor Sounds like a butthole.
Try checking the area for an Amateur (HAM) radio club, or at least some
operators. Look at www.arrl.org, and see if there is a club in your area.
If there is, someone there will probably be able to offer some things to
try.
Remember, it is easy to assign blame, but in reality, it is most likely
the the equipment that is receiving the interference, and not the
transmitter that has the trouble. FWIW, the local police, and courts have
no authority in these matters. It is the sole jurisdiction of the FCC in
matters of this kind.
Feel free to email me, if you need any more advice.

On most of these radios PLL data is feed to the the diplay and the display shows what freq it is "supposed to be on" according to the freq the VCO is operating on. The VCO is usually mixed with a couple of other freqs to get the final freq. If these are a little off so will the final freq.

Thanks for the "kind" response. Just asking a question and trying to learn
something, which I thought was what this NG was for. I don't own a radio
with a frequency display so I can't "read the manual".

Richard.

I believe on the 2950 the display uses digital info that the frequency
generating portion of the radio also uses. In other words the display
itself can not drift in numbers but the radio itself can.

>73's, "Horse"

Make one.

For a short harness use an electrical 1/4 wave sections of 75 ohm
coax for each antenna.Then run any appropriate length of 50 ohm
coax between the T connector and the radio.

1/4 wave 66% velocity = 70 inches
1/4 wave 78% velocity = 82.5 inches

6019. ? 27.535 lsb ?

These are not frequency counters, just displays. The rigs will drift
around, and you'll never know it until someone else transmits. Come to
think of it, you may not know it then, as they are probably drifting
around also. Either way, it's just a ballpark reading.

Hmmm ... the legal limit is 1500 watts pep OUTPUT. Bear in mind that the linears will be running somewhere a bit over 60% efficiency. This means that 3000 watts input will give you around 1800 watts output. I have seen posts from people claiming 3000 or even 5000 watts output. You'd need 8000 watts input to develop that kind of power. Also, that 60 percent efficiency is the finals ONLY. This does not take into consideration filiment power (if a tube amp) or losses in the transformer and power supply. Now the service to a house is 220 volts. You're talking a 40 amp 220 line to run that kind of linear. Maybe there are a few nuts running that, but most likely, IF they are, the gear is homebrew. Most amplifier companies are going to sell those things to legitimate customers only (not hams).

As far as the modified equipment, I was first licensed in 1962 and have NEVER had modified equipment (although my first rig was a Johnson Ranger which had 11 meter capability since 11 meters was a ham band when it was built - but I never used it on 11 meters, nor 10 either). I have a number of ham buddies and none of us have modified equipment. So, although I am sure there may be a FEW hams that do this (both services have plenty of nuts and fruitcakes), until someone proves there are a substantial number of them I'll doubt it is a problem. Remember, they are the ones who have more to lose.

That might not be exactly true. At the very least, it would involve a risk by the officer. If a police officer arrests me for some violation of a CFR or USC statute where there is no clear local jurisdiction, and the Federal agency with actual enforcement power declines to prosecute me, I will be suing the officer for false arrest.

Well I don't know about all that Twistedhed. It did sounded like an order taking service that companies contract out to. A recording answered the phone and transferred me to "sales" where another recording greeted me and told me to hang on, someone would be right with me.

If this was a service, you can't really fault Copper since it wasn't one of their staff members. And the owner of Copper has already approached me with the offer of a co-phase harness for free as a good will gesture. But I think I'll pass. I've already had enough e-mails mixing me up on what size to get, what impedance, what length, what velocity, what brand. Think I'll just go back to my "squirrel spanker" 102 inch whip...

You're better off with one antenna. Unless you can space the antennas 1/4 wave apart, co-phase is a big waste of time and money.

>Check the SWR to each antenna. If it is low(less than 1.3:1) use the 75 ohm
>cable to make the harness, if it is more like 1.5:1 use 50 ohm cable.

If the single antenna is <37.5 ohms at resonance then use 50 ohm coax.
If the single antenna is >37.5 ohms at resonance then use 75 ohm coax.

Antennas that are free and clear of obstruction, like a roof mounted
antenna will most likely be above 37.5 ohms. Antennas mounted
around obstructions, like bumper mounted, or even mirror mounted
will most likely be below 37.5 ohms.

On or about Tue, 19 Sep 2000 03:04:59 GMT, kc2elo
<kirk_mefford@my-deja.com>, using the forum rec.radio.cb did say:
:as "most" everyone else has told you.. it's just a display. but out of
:my experiences with the 2950 it's about the most stable ssb radio I've
:ever had. it will drift a little (as with any ssb radio) but the
:tolerance is a lot better than most radios. if it's alligned properly
:you should be very happy with a 2950. beats a cobra/galaxy/uniden/ you
:name it.
:
:just my opinion but take it as you will.

Interesting...

My Grant XL drifts while its warming up, for about 10 minutes. After
that, it MIGHT wobble 10 cycles in 10 minutes, here and there,
depending on the stability of the power input.

But then again, any radio, properly tuned, should be relatively
stable.

Just my two cents.

Almost agree here, but you can check RS for a package of split toroids which you can wrap the speaker wire through several turns. There are no instructions with them, so wind as many turns through the material as possible and still snap it to. If it is practical for you, there is such a thing as shielded speaker wire, and though pricey, it might well help thiss situation.

Just got these back from the repair tech and they are good to go. Both come with box, manual, stock up/down mic, mounting bracket (but no thumbscrews), and power cables. One has mini speaker jack mod on back, the other is stock with accessory plug. MRF 477 finals, and 26.000-29.666 AM/FM/SSB/CW and really talk. $150/each plus priority mail and insurance and tracking. US Post Office money orders or Paypal only. NO CODs

Why with hams it is all or nothing? I never said all! But mods and
freebanding may be bigger than you think!

Do not get me wrong X349, I think many of your concerns are valid. But
what exists today has always been a part of 11 meters. As we grow older
we should grow in wisdom and become more tolerant of others. I live in a
large city and freebanders with big amps have always been around. I have
very little problem with locals on 10 meters. I also never get CBers
coming through my phones or TV. Alot of what drives hams against CBers
is the "I had to learn and study to get HF privileges and CBers just do
it" attitude. Hams tend to make the problem much bigger than it is. If
it was not for CB, hams could not buy a 10 meter rig for under $300.00.
I tend to find some positives in everything!

I have never understood why someone with a ham license that has all the ham bands to operate on with
the different modes and power levels that ham radio offers would want to operate on other frequencies
(CB and/or the so-called "freeband") illegally.

HI

There are still many good CB operators out there, many who still want [and dare i say, still believe in] the CB "brotherhood".

But the problem is that we don't do anything about it and are letting the idiots and hell raisers control OUR airways.

But we can improve CB and restore it to it's former glory by doing 4 simple things:

1] If everyone who reads this post gets atleast 3 people to become CBers.

2] Everyone who reads this post agrees to monitor Cb channel nine atleast once a week.

3] Everyone who reads this post agrees to NO profanity on the air.

4] Let the foul- mouths know that they aren't wanted.

Then the CB hobby will grow and return to an enjoyable family hobby.

I already know that within a few days there will be posts saying I am wrong, But this is only my opinion on how we can improve the hobby.

Better, try using a battery driven transistor radio to determine if the problem is in the wiring or the result of front end overload. I understood that he had tried multiple radios with the same speakers, so my inclination is to guess that the length of the wiring for the speakers is contributing to the problem by being cut to a resonant length. That's why I suggested toroids earlier--cuts the rf as well as changing the electrical length of the wire.

I guess he could also wrap the garage in aluminum foil......

The critical consideration here is that you DO HAVE a ground plane. Either way, from the stake hole or from the fender lip, the signal will be somewhat directional because you have more metal on one side of the antenna than the other, so to that extent it doesn't matter much. You just don't want to put the antenna right up behind the cab where it will interact with the metal from the cab's vertical surface. Use good coax, route it away from any known electrical wiring, and wire the radio electrical to the battery directly, fusing both positive and negative. Yes, fuse the negative. It costs 2 bucks and if something weird happens, like an accident, that wire might serve as the source of some high amperage flow, rendering the radio toast. Fuses are cheap. Even cheaper if they save the radio.

Message-ID: <Q5gx5.93617$Ur3.1102973@news1.sttls1.wa.home.com>
Source record: 52318

Hi Everyone:

Several years ago I had the same problem and fixed it for less than 2
bucks.
The Stereo receiver I have is an old Technics SA-222 and 2 large speakers
in the same room with all my Transmitting gear and the stereo is always on
with the volume
down most of the time.
I did the disc ceramic capacitor trick. .01uF disc capacitor, Radio Shack
part #272-131.
One capacitor for each speaker lead so for a stereo you will need four. Just
connect one
side of the capacitor to stereo chassis ground and the other side to one of
the speaker leads.
Once I realized it worked I took the top cover off the stereo and soldered
the caps in place
inside. I have run over a kilowatt on all the other bands with a multiband
dipole over the shack and
the stereo does not flinch a bit.

Hope this helps.
Tom

The smaller CB radios would not take up any more space than a hand held and I suspect will perform much better. By far the most importent link in the system is the antenna. Get a Wilson 1000 mag mount for about $60.00. Express Electronics has a small Texas Ranger CB TR 121 WX for $69.99 peaked and tuned. It even has the national weather channels on it. Just put it on the seat beside you (upside down so you can hear the speaker properly) and plug it into the cig lighter. I've done this alot when I had to switch between different cars. It works fine. I think you would be far happier with the results and ease of use of this solution compared to using a hand held. Dont forget to get the antenna adjusted for your best SWR. Webb site for Express Electronics below.

sure there is more use by illigal users on the low end of the 10 mtr
ham band,and I bet if hams were to come around and try to getrid of
them,they(the truckers,and a bunch of others) would prolly tell them
to go pound sand...first the cbers overran some bizness freqs on 11
mtrs just above the old ch 23,and now they are coming right into more
space reserved for hams...my moded radios stay well below 28
mhz...cheers

PAL 321 forsale. All (4) 8950 tubes checked good anywhere between 90-95%. Puts out about 200-250 watts off my Cobra2000 with a 3.5 watt carrier and 20 watt pep. I've seen this unit do more off of my AR3500 with a 4 watt carrier and a 55 watt pep (around 350 watts or so). Excellent driver for a big box or use by itself.

Selling for $250.00 firm just for the cost of re-tubing this unit. I'll even throw in an extra 8950 for shits and grins. Email me if interested and thanks for looking.

>>>in other words beaker doesn't know.<<<

like i am gonna memorizethe factory tolerances on all the major radio types for freq. drift .

but every radios specs is on the website for the company that made it .

people call me stupid , when ever week you will see one post asking about noise on a radio from a fuel pump . asking about the specs on a antenna shit a simple search engine would solve . hell even simple common sence , your looking for the mod on a radio , maby try cbmods.com . you want to know the freq tolerance on a rci . find the ranger website .

and like i said many times , i am admittedly an asshole and full of shit .

at least i am honest about it

>Is 27.535 lsb the freq most ssb's use on the upper channels?

LSB is mainly used around the US. USB is used by the US and other international stations. Few countries use LSB except Mexico. 27.555 USB is the "international calling frequency". If you wanna talk around the US, try below 27.555LSB. You can also try 26.285 USB - That is the other "international calling frequency".

I have a Yosan JC-1103N hand held that I picked up at auction. Anyone have any information on this radio? Kinda interesting 'cause it has 4 bands of 40 channels. Made by our fine friends in Korea, well, that's the name of the Company that markets it.
Any help would be appreciated.

Thanks,

Jeff

6086. Antenna Rx

Newsgroup: rec.radio.cb
Date: 2000-09-19 00:00:00 UTC
From: nick250@aol.com
Message-ID: <20000919171336.23438.00004810@ng-fi1.aol.com>
Source record: 52571

I understand that far and away most important factor in radio transmission is a properly tuned antenna. Does the antenna hold equal standing in radio reception? Or does the radios capabilities come more into play in reception than the transmission. I am talking mobile operation in a car if it makes a difference.

TIA Nick

chances are they will have the proof before they knock on your door. But this has reminded me of something I thought about a while back even though it has nothing to do with CB. We all know if a cop looks in your car and finds dope laying in plain sight its yours. So with that in mind if they put locks on your tires would that mean they are yours to cut off or do whatever you want with them. sense they are in your posession. Just a thought.

Nick,
The quick and dirty answer is, yes. There is a property called
'reciprosity', which is just a fancy name meaning that a good
transmitting antenna is normally a good receive antenna. Although
the opposite isn't always true.
A mobile antenna just doesn't have to be as good as one used in
a fixed location. Most mobiles, even those using amplifiers, may
not be heard by those that they can hear, since most mobile antennas
receive better than they 'talk'.
'Doc

The antenna is equally important for tx, and rx. The best radio will not
overcome a poor antenna, while a good antenna will help even a so so
radio.
In a car, you may have more trouble overcoming RFI coming from
electronics outside the radio. When this happens, even a good antenna is
not much help.

Message-ID: <ni6gss8uan2fanfb3vpim0k34tvdes1u5k@4ax.com>
Source record: 52591

I've explained it thusly:

Equate your CB with your Stereo, and your antenna with your speakers.

A Sparkomatic stereo can sound really good on Bose or Klipsch
speakers, but doesn't sound so good on the stock speakers from a
Pacer.

An Alpine stereo counds really good on Bose or Klipsch speakers, but
doesn't sound so good on the aforementioned Pacer speakers.

So, a not so good stereo will get great performance from a good
antenna, though a great stereo will sound even better.

Transfer this over: a little Cobra 25 on a properly tuned, efficient
antenna system can sound louder and cleaner than even a properly tuned
Galaxy 88 on a not-so-good antenna system.

Receive is the same way. If the antenna is more resonant, it will be
more sensitive to the particular frequencies desired, and your ears
will be better.

On receive, think of the antenna as a Microphone. That stock mic
works, but the Astatic 636L works better. In a noise-free environment
(a home base station, for example), even that D104 will sound much
better than that stock mic...

You still need to make sure your radio is properly tuned, not to
overmodulate/bleed over, and to receive properly. Many techs ignore
the receiver section during tuneup. The good ones won't.

I hope I didn't cloud the issue with this.

So.....
1. What's happening to the "dot" frequencys
2. What's the point of this new service?
3. (IMHO) this is a bad idea. You're going to get CBers going out and buying 2m HTs so they can modify them for use on this (like the TH78 and 79 can be). And, as in most things, they are going to "accidently" be using a 2m frequency more often then not.....

OK,

Let's say that I am driving thru Indiana. I am a licensed ham and have
my license in my posession. A cop stops me because I have an antenna on
my car (there are 3). In spite of the fact that I produce my license,
he confiscates my equipment (which at this time does not include a
scanner), what then? I have no recourse as the return or replace-
ment of this equipment? I must return to Indiana to face a trial for
a non-existent crime, fight to get my equipment back, and have no legal
course against the officer who falsely arrested me? That SUCKS! And it
sounds like "Sieg Heil" shit to me!!!

Jerry

Driver bias needs to be around 35mA. Final should be 50 mA. Both
tested on USB, channel 19.

One lead on the ammeter should go to TP7/8, and the other lead goes to
the wire that was on TP7/8.

Just got these back from the repair tech and they are good to go. Both come with box, manual, stock up/down mic, mounting bracket (but no thumbscrews), and power cables. One has mini speaker jack mod on back, the other is stock with accessory plug. MRF 477 finals, and 26.000-29.666 AM/FM/SSB/CW and really talk. $150/each plus priority mail and insurance and tracking. US Post Office money orders or Paypal only. NO CODs. PRICE IS FIRM.

Remeber that you are measuring current here and must hook the meter in
series with the collector supply. Are you doing that?

6124. Re: Galaxy FC-250 Frequency Counter - Power Rating ??

Newsgroup: rec.radio.cb
Date: 2000-09-19 00:00:00 UTC
From: Professor <bgriffey@kwom.com>
Message-ID: <8q7r93$h4u$1@nnrp1.deja.com>
Source record: 52628

Frequency counters are very high impedances as a rule...
That means that the RF power is not passing through the counter area...
it's being "picked off" that line. You should really be looking at the
coaxial line inside the counter to get an idea of the power handling
capability of that transmission line.

From: mr137@my-deja.com
Message-ID: <8q7srb$j14$1@nnrp1.deja.com>
Source record: 52631

PAL 351 forsale. All (4) 8950 tubes checked good anywhere between 90-95%. Puts out about 200-250 watts off my Cobra2000 with a 3.5 watt carrier and 20 watt pep. I've seen this unit do more off of my AR3500 with a 4 watt carrier and a 55 watt pep (around 350 watts or so). Excellent driver for a big box or use by itself.

Selling for $250.00 firm just for the cost of re-tubing this unit. I'll even throw in an extra 8950 for shits and grins. Email me if interested and thanks for looking.

It looks to me like it's a Molex plug. Try Newark or Digikey if you want
to brew one up. I've got the same radio, and it doesn't have that
plug. You can always solder on your own plug or just wires and remove the
plug.

A 5/4 vertical antenna sux for the most part. I speak from experience. On the lesserr part it has some interesting skip characteristics. The high radiation angle will let you skip into areas where others are not leting you work places that are not so crowed when the skip opens. It is an intereseting antenna to have around. Mount one at ground level and be ready to hook it up when the band opens. Sometimes you will see openings on it before you see them using other antennas.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 45.00 (US$) INCLUDING shipping from Canada
Great deal ! ! !!
A Picture can be e-mailed.

well go to the hygain website, and look at this rotor and its specs,
and compare to the windload resistance of that particular beam, it will
probably hold it ,but don't know,......cd is out.....

the english grammar skills around here are just incredibly awful sometimes. i am going to tell you something my friend. if you want to go out in the real world and get a good job when you get out of screwal, you had better learn how to read and write correctly. of course maybe you have already graduated , i don't know, but for you to get on here and display a patent butchering of the english language is a bit unpalatable. and you ask me why i hate paying taxes for these people to go to school and this is the result of all my money being wasted. it is really incredible. no wonder a guy like al gore has a chance to be the next president. with people like this running around breathing my air, and actually having the right to vote, is rediculous. i don't think you should be able to vote unless you understand the issues and anyone who cannot read and write correctly certainly does not. we had better wake up and smell the coffee. the dumbing down of america is actually taking place. just look around,.....cd is out.....

Check the SWR to each antenna. If it is low(less than 1.3:1) use the 75 ohm
cable to make the harness, if it is more like 1.5:1 use 50 ohm cable.

No advice, just my favorite position on a truck. On top of the cab, centered from side to side, about 3 inches from the back of the cab. Punch a hole and mount your favorite 5 ft or longer antenna. Usually not to hard to snake the coax in next to the windshield and over to the dome light.

6147. Re: Does anyone have a 4 element moonraker design/measurement manual around

I have a Moonraker IV beam that is circa 70s. Every element on it has been replaced, Boom too for that matter due mostly to damage incurred whenever I had to move. Did not like the size of tubing used for origional elements so I used some larger tubing with no problems. I think the origional was 1/2 and 3/8. I used 5/8 and 1/2. I just did some pricing on tubing at Home Depot and they have some that should work fine and it would probably cost about $50 per element pair at there prices.

People seem to think that if they are arrested and either 1) the govt. decides not to prosecute or 2) you are cleared of charges through a trialor other means that you may sue for false arrest. That is not the case and your lawsuit would fail.

HI

I use CB mostly for when i travel, monitoring Ch.09 and shooting ship.
Sometimes i'll use it for base to mobile and mobile to mobile communciations
with my family members when we are in seperate cars on trips or when one of us
goes out shopping.

But what i meant by CB should be an "enjoyable family hobby" was that CB
should be in a state where little kids and their parents can use / listen to a
CB transmission without hearing profanity.

[As i said in my other post, this is only my opinion on the matter.]

I knew someone was gonna say something about me calling CB a hobby. LOL
I noticed that some people consider CB a hobby and others don't, so I had
wanted to avoid the term and was reluctant to put it in my post, but for lack
of a better word I used it.

=)
Keep Safe & warm

to
> manufacturing tolerances ?

as "most" everyone else has told you.. it's just a display. but out of my experiences with the 2950 it's about the most stable ssb radio I've ever had. it will drift a little (as with any ssb radio) but the tolerance is a lot better than most radios. if it's alligned properly you should be very happy with a 2950. beats a cobra/galaxy/uniden/ you name it.

just my opinion but take it as you will.

Indiana code makes it illegal to posess a "portable police radio" anywhere but in your residence or business.

A number of persons are xempt from the law.Among those are anyone posessing an Amateur Radio License. I cary a copy of the current section of the Indiana code in my vehicle.

The police officer making the bust was obviously unaware of the exemption.I have been questioned on it several times as I have bolted a scnner into my cars since about 1983

Source record: 52614

Howdy,

I was a CB nut years ago and loved it. A friend gave me her old 148GTL yesterday to play with. It's about ten years old and needs work. The first thing I was going to do is set the bias on the driver and final. All the info I found on the net says use TP7 and 8. Found them easy. Now what? Connect meter to TP7 and to ground. Key the radio. Meter reads zero. Supposed to read ~100ma's. External RF watt meter reads 5 watts output so the radio works well enough. I tested the meter with a AA battery. A OK.

It's has to be how I have the 148GTL connected to my DVM that's the problem. Any ideas?

Thanks,

MD

6158. CB/Whip install questions.

Newsgroup: rec.radio.cb
Date: 2000-09-20 00:00:00 UTC
From: "Ron R. II" <r-riekens-ii@juno.com>
Message-ID: <8qa2t2$5np$1@nnrp1.deja.com>
Source record: 52670

Hello,
I am trying to find out if I installed my rig correctly, local radio shack was somewhat ahem, helpful <G..

I have the unit floor mounted in my 4x4, red to power, black grounded to a dash screw (steel dash in 78 chevy), coax runs out of cab to whip.

Whip is a firestick, I have it mounted in a modified window hanger mount that is wedged into the stake pocket of the bed with one of those twist in tie downs.

I have the center lead running to a loop terminal that is bolted to the end of the whip and the whip is isolated from the mount by plastic washers.

I pulled back the insulator around the outer braid, and wound a ground wire around that and ran it to a bolt on the bed.

Weird part is that this setup generated a ton of ignition noise, but if outer braid was in contact with center lead I get no noise and was able to talk with a trucker at short range for a radio check, that being so I took the braid and crimped it into the ring terminal with the center lead running to the base of the whip.

Does this sound right?

I had started by putting a 4 watt noise filter into the system but that did nothing.

Unit is an old 40ch realistic with volumne and squelch, barefoot.

Any idea what sort of range I should get out of this?

What if anything do I need to change/redo on my wiring?

Hard to get radio checks as seems like not many people out her in Oregon City, OR are on air, or I'm missing the common chanels during high traffic time.....

Any info/advice appreciated as setting this up to replace dead cell phone for emergency commo when out in woods with the missus for some target practice.

Thanks
Ron

Ron:

I'll comment in the body of your post.

On or about Wed, 20 Sep 2000 10:18:24 GMT, Ron R. II
<r-riekens-ii@juno.com>, using the forum rec.radio.cb did say:

:Hello,
:I am trying to find out if I installed my rig correctly, local radio
:shack was somewhat ahem, helpful <G..

They usually are "helpful".
:
:I have the unit floor mounted in my 4x4, red to power, black grounded
:to a dash screw (steel dash in 78 chevy), coax runs out of cab to whip.
:
That sounds right.
:
:Whip is a firestick, I have it mounted in a modified window hanger
:mount that is wedged into the stake pocket of the bed with one of those
:twist in tie downs.
:
Not the greatest antenna, but it will do.
This mounting situation sounds "hinky" to me... Maybe you could rig up
a piece of flat steel or thick sheetmetal that you could attach to the
bed insde thru the steel on the stake post. That would at least give
a better ground, and at the most would provide a more stable mount in
the bed.
:
:I have the center lead running to a loop terminal that is bolted to the
:end of the whip and the whip is isolated from the mount by plastic
:washers.
:
I hope you mean the base end of the whip. Usually the attachment for
the center lead of the coax is made on the bottom of the mount, but
this isn't the only way to do it.
:
:I pulled back the insulator around the outer braid, and wound a ground
:wire around that and ran it to a bolt on the bed.
:
Solder works better, or better yet, drill a hole on the inside of the
bed, crimp a connector on the braid, solder the connecter to the braid
(yes, even after crimping it on. Trust me.) and put a screw thru the
connector and into the bed. Decent ground, and a better arrangement.
:

:Weird part is that this setup generated a ton of ignition noise,

If you have ignition noise, the problem is your ignition. Put resistor type spark plugs in, and get a set of decent plug wires. The silicon noise repression type are nice, and they work well. This will cost a few bucks, but it will help the ignition noise.
Also, check your ground on your coil, make sure all the contacts to your ignition system, and on your battery, are clean, and rust/corrosion free. Use steel wool to clean the faces of any eyelet or knife-edge connectors in the ignition system, and baking soda and hot water to get that nasty white junk off the battery terminals.

: but if
:outer braid was in contact with center lead I get no noise and was able
:to talk with a trucker at short range for a radio check, that being so
:I took the braid and crimped it into the ring terminal with the center
:lead running to the base of the whip.
:
EEEEEEEEEEEEEEEEEEEK! Aaaaaaaaah! Yikes! Zowie!
Um. Sorry... got a bit carried away there. ::chuckle::

Connecting the braid to the center lead is a bad thing. a VERY bad thing. (Ok, under certain controlled circumstances, it works, but this situation isn't one of them!) Work on suppressing your ignition noise at the source, the ignition. If you can't get it down far enough to talk 3 or 4 miles on a barefoot radio, and hear that far as well, then you'll need to take other actions (besides connecting the shield and center directly together) to suppress the noise.

:Does this sound right?
No. See above.
:
:I had started by putting a 4 watt noise filter into the system but that
:did nothing.

Power lead filter or coax filter? I suggest putting a power filter in to every CB installation, regardless of wether there's noise or not. It's just good practice, and they only cost around $15. I suggest the 4 lead type, and not the 3 lead. +/- in and +/- out. They seem to work better, in my experience.

Most of the coax-installed filters that I've run into are nothing but attenuators, and all they do is cut down your ability to receive...not just interference, but signals as well. Fix your ignition system, not the radio/antenna system.

:
:Unit is an old 40ch realistic with volumne and squelch, barefoot.
:
:Any idea what sort of range I should get out of this?

3-4 miles, maybe more, maybe less, on a noisy day. 15 miles on a quiet one. Just guesses, of course.

:
:What if anything do I need to change/redo on my wiring?
See above
:
:Hard to get radio checks as seems like not many people out her in
:Oregon City, OR are on air, or I'm missing the common chanels during
:high traffic time.......

Well, you've killed your output signal by connecting the braid with
the center lead, Most of your RF is going right back to the radio on
the braid of the coax, so you're not going to get out very far, or
hear very well either.
:
:Any info/advice appreciated as setting this up to replace dead cell
:phone for emergency commo when out in woods with the missus for some
:target practice.
:
:Thanks
:Ron
:
:
:Sent via Deja.com http://www.deja.com/
:Before you buy.

Hope this helps

what are you going to get a patent for certainly there are led drivers
already that make leds blink , turn on, random patterns... I don't see where
you invented anything... you are using the existing lights on the car and
are adding a type of electronic voltage control..

You obviously don't know much about patents... (or anything else for
that matter). You can patent an idea! I know you haven't had an idea
in about twenty years but some of us have. You can take existing
electronics and have a unique application for it... and patent that...
you putz!

the reason those 49 mhz handheld were not popular is because they are toys. 100 milli watt levels and no real antenna. with this service 2 watts is plenty and would do a lot better than frs or gmrs (whick are popular) for a certain amount of peoples needs. this is hardly a competition to CB on 27 mhz and it wasnt intended to be.

Tim:

Try a little expirament. Put some coax on the SO239 on back of a radio
in your home, hook it up to a meter, then hook your dummy load onto
the meter, power it on, and have someone go out to the mobile in the
parking lot, key up on the same channel, and transmit.

See if you hear them.

Odd conditions beget odd occurrances. It does happen.

It's not that the sound quality will be crappy... but the modulation
level will be rather low at only 2.5KHZ deviation. It would be like
talking on a stock AM radio with a stock mic. Getting a 5KHZ shift
would pep up the modulation considerably...

What frequency is this new band supposed to be located on?

Source record: 52696

Ron,
I'm suprized you've had anyone answer you at all. There is
one thing that is wrong, and a couple that are 'sort of' wrong
with how you have the antenna installed.
Do NOT connect the braid to the center conductor of the coax.
What this does is 'short out' the antenna, it's like it isn't
there at all. Effectively, the only antenna you have is the
coax feed line from the radio to the 'short'. Not good, and
the radio doesn't 'like' it at al.
While you got a lot of ignition noise, the first way you had
it hooked up was correct. The noise is a seperate problem.
Center wire of coax to the 'screw connection on the center of
the antenna, at the bottom. Braid connection to 'ground', and
as close to the base of the antenna as possible. A bolt through
the body at the base of the antenna would be best (use lock-
washers). This will get you into the 'ball park', you can 'tweak'
the antenna later (if it needs it).
Ignition noise:
All the noise you heard is almost 'normal' for most vehicles.
To get rid of it requires that you shield the radio/antenna system
from it. Resistor plugs, or ignition wires, may help, and there
are a couple of other things that will reduce the amount of noise,
or eliminate it.
The 'mainest' thing is to seperate the center conductor and braid
of the coax feed line.
'Doc

I have minimal experience with FM (mostly low power) and agree most of the extra junk is useless, but if power mics are no good for FM why do so many broadcast (DJs, newscasters) commercial FM radio stations utilize power amplified mics? I have seen amplified boom mics in studios with enough sound effects to rival a Hollywood set, echo included. Many pirate radio stations also have power amplified mics and the such and the sound and effects produced are conveyed to the listener with amazing clarity.

That is how the modulation is applied in FM. It directly correlates to what's called in FM the "modulation index"...

There's a lot of precedent for this being
acceptable, as similar devices have been
sold for years as aftermarket accessories
for motorcycles. Both headlight and
brakelight modulators have been common
for nearly two decades. The first such
device I remember, from the '80s, was
trademarked "Q-Switch". For the same reason,
I wouldn't hold my breath on being granted
a basic design patent on something that
has been in the public domain for 20 years.
It's a little late to be "inventing" headlight/
brakelight modulators.

You might obtain a patent on a particular
circuit detail for a modulator, if it is
truly new and unique, but that would only
give you protection against one of the
other makers using your particular circuit.

6192. Re: FLASH-* FCC Announces NEW FM CB SERVICE!!!

Newsgroup: rec.radio.cb
Date: 2000-09-20 00:00:00 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8qb8h3$3qn$1@slb6.atl.mindspring.net>
Source record: 52704

For AM CB communications, power mics are an aid to fully modulate the carrier (or overmodulate it) AM stands for Amplitude Modulated; the higher the amplitude up to 100% or beyond that to the point of intelligibility, the louder the signal sounds in comparison to one less modulated.

FM is Frequency Modulated. The frequency deviates (swings below and above base carrier frequency) when modulated. The more it is allowed to deviate, the louder or clearer it is perceived (again within reason). There is absolutely no need for more than 100% modulation, as the deviation controls the presence of the signal. The more the deviation, the wider the bandwidth the signal can occupy and the higher quality the sound can be. As far as studio effects for the Mic, the higher quality the signal sent to the transmitter, the higher quality the signal is available for reception. In this case volume or amplitude has nothing to do with it as long as the mixing board/console sends audio to the transmitter at or near 0 vu or what would be looked at as 100% on AM.

Ham rigs are set for +/- 5 KHz deviation. The FRS/MURS units are only allowed 2.5 KHz. If both signals were of equal power at the antenna (ERP=Effective Radiated Power) and received by the same radio which was capable of 5 KHz deviation on receive, the one that had the most deviation (5KHz as opposed to 2.5 KHz) would have higher signal to noise ratio, therefore seeming louder locally and more range as the distance increased. The higher the signal to noise ratio, the better chance the signal can be received on the fringe of it's effective signal.

Probably not the best explanation, but at least touches on the differences. I am sure there are some inaccuracies in my comparisons.

Maybe this is so simple I just don't get it.(It's happened before) If a fixed transmitter is at, say, 86.9 on your FM dial, and your intended listener is say, a half mile away, and the transmitter drifts 2.5 either way, yes I understand it wil sound bad, but depressed? Isn't this just a clarifier (tuning) issue, or is there more to it than that?

I know enough that the simple idea you are trying to do is not any electronic breakthrough or a great invention. A bar graph driver with a rc network will do what you are trying to do. The first step in obtaining a patent is that they do a patent search for anything related to what you are trying to patent then your item must be unique from all other items currently patented So your patent possibly could be good for a flickering brake light that blinks 20 times a second.i highly doubt the electronics since there are plenty of these out on the market already..

Thanks for the explanation. The deviation is what threw me into the void. I was directly associating this with the modulation process in itself. Haven't done a whole lot of reading up on FM, just the basics and what I've learned from some pirate radio around here. I'll keep reading.

were not talking about drifting. deviation is the amount of modulation to the fm signal. if your listening to a commercial fm station which i believe is a 12.5khz signal on a 20khz deviated reciever then it will sound weak just like a 2.5khz will sound week on a 5khz reciever

What I think you mean is what is called audio compression. It goes back to a gizwidget called a Gates Sta-Level that let the rock-jock bounce all over the studio with no one the wiser. In its simplest form it is a lot like AGC in your receiver; the gain is adjusted depending on the last few moments of signal. The odds are that some form of compression is already in most rigs, AM, FM, or SSB, and more than likely in your church PA system. Even the very early CB rigs (a Lafayette if that is old enough) had it built in. The reason for it is that if you arrange voice modulation so that the peaks are at '100%' whatever that may be in a given application, the average will be about 35%. Compression raises it to about 60 or so. Tune your FM receiver to the local classical station and then to the local rock or CW station and you can hear the effects of compression (the classical buffs would remove the head from anyone using compression on Mozart). This is not done without cost. It puts a strain on power supplies in audio and linear service. Of course finals get warmer as well. It is all in what you like.

Where you put the mic preamp is of no significance so long as you do not do it twice and get your levels screwed up. The argument for putting it in the mike is that you do not have long runs of low-level audio to pick up noise, hum, etc. It happens that high-quality mikes have low output so the argument is even better in broadcast circles. Catch Radio Spain BTW if you want to hear first-class AM audio. Sound effects are just a matter of what you want the listener to hear. Remember George Carlin's WINO?

To do it with clarity requires ruthless attention to level, impedance matching, and system design. Give your engineers credit for what you hear. Having two preamps, one in the rig and one in the mike, is a formula for cruddy audio.

FM is a receiver dependent system. It is the receiver that determines what '100% modulation' is. On the tube or FM broadcast, it is an apparent 75 KHz deviation. When CB came into existence, 15 KHz was standard for voice work and frequency stability was so bad that the receiver had to have a 40-50 KHz passband to compensate for transmitter and receiver drift. So most channels

were on 50-60 KHz spacing. As life moved on, the channels were split (leaving a pile of good surplus equipment to start Amateur FM which was originally wide-band) and have in fact been split again. In the meantime, PLL has made frequency stability just all kinds better so receiver passbands have been tightened up as well. So when the receiver will only admit about an 8 KHZ bandwidth, there ain't just a lot of sense of feeding it a wider signal. Those thinking that if 2.5 deviation is good, five is better are in for sore disappointment. BTW a good 'rule of thumb' is that a signal is three times wider than the apparent deviation.

Audio in general and FM audio in particular is a matter of using what the receiver gives you to perform a task. AM having been around a little longer and not being quite so receiver-dependent in the first place has spawned cute stunts that generally accomplish not a lot. The 'swing kits' are a rehash of Taylor Modulation from the 40s, for example.

The short message is that the 'AM attitude' applied to FM will produce fiascoes by the bucketful.

In a frequency modulated tranmitter, the more deviation from the carrier frequency, the higher the modulation level. If that deviation is limited to 2.5khz, but someone runs 5khz, and the receiver is capable of understanding and decoding that much deviation, the 5khz deviation radio will be "louder" than the 2.5khz one.

You're thinking AM... FM is a different animal.

in FM the deviation is intentional, and it's how the modulation is
transmitted, as opposed to varying power output on the same frequency,
which is how AM is transmitted.

> 2.5khz will sound week on a 5khz reciever

FM theory has gone thru a lot of development over the years. In days of old, it was thought that deviation (more on that subject later) had to be at least five times the maximum modulating frequency (dev/max mod freq = modulation index). This meant 75 KHz apparent deviation was the norm for hi-fi audio systems doing up to 15 KHZ audio while communication FM with a 3KHz max audio used 15 KHz deviation. Communication is now done with 2.5 KHz deviation.
The 75 is still current on FM and TV audio. That is why we use 200 KHz spacing on FM.

The frequency of the carrier does not in fact change. What does happen is that power is taken from the carrier to produce sidebands at multiples of the audio frequency modulating it. The center of power moves plus and minus making it look that way. It was a while before anyone really realized what was happening. Depending on when the book was written, you might get several explanations of FM.

You might want to stock up on Prozac yourself. There are few Amateurs who have not had this happen. Heathkit dummy loads are better radiators than you think.

Thnaks Dick for explaining it in a laymans language that this non-tech can understand. From what I read here I am under the impression AM is much more forgiving than FM. Sounds like you know what I was referring to in the studio. I scan plenty of FM, but was never interested in the transmit aspect until a few high school kids took over a portion of the commercial FM spectrum band this summer and rocked an entire weekend from a boat in the Gulf before ceasing their broadcast.

Hmmm interesting point about RFI in a mobile setting. So if I spend an extra $150 for a mobile radio with the super dupe tuned up recieving capabilites and I end up recieving extra "noise" along with the signals I want thus negating any advantage the superior recieving capabilities provide. Is that what the problem may be?

Actually, I mentioned these points last week when the news first came out.
The link I listed for the info will also link to the FCC citation and NPRM
concerning the previous use of this spectrum and their rational behind the
restructuring for public use.

http://www.provide.net/~prsg/murshome.htm

Actually, there is probably more chance of abuse from hams who already have
MARS/CAP mobiles and HTs than from CB ops who would have to purchase
additional gear just to work a line of sight band with QRP HTs. Think about
it.

A 50 watt 2m mobile would make you the "channel master" in addition to the 5
KHz deviation in a 2.5 KHz allowable deviation service.
The same abuses can be counted on as have surfaced in the FRS spectrum due
to Hams or CBers using 70cm gear. Is it an epidemic in your part of the
woods, or are you just thinking outloud?

Thanks for your response SSB. The antenna radio relationship while transmitting I think I understand pretty well. The recieving thing still a bit cloudy. The specific situation I am trying to figure out is the following. Mobile use, mostly used while on the road on 11 meter ch 19 mobile in a car using a wilson 1000 mag mount. Occasional ssb use for fun, but thats secondary. In that "on the road setting", does the recieving part of a more expensive radio (a new RCI 2950 EX for example) pick up extra "noise" to cancel out its superior capabilities? Or will there be a real world benefit to the radio with the better reciever.

Thanks for your help and patience while I learn (obsessing my be more like it) what I need to know before plunking down my money for my new radio.

My personal opinion is that this "service" is going to fail. After reading a lot about it, I can't see it being any more popular than those 49mhz hand helds that you can buy - there will be very few people into it and it'll probably be just another "FRS"... I don't think CB is going to go anywhere.. it's on 27 mhz to stay.

The first thing you do is get a lawyer because there has to be probable cause
and having antennas on your car is no probable cause.

>and have no legal
>course against the officer who falsely arrested me?

You can sue him, the department and the municipality/state in civil court...

Liken it to forfeiture and/or a revenue generator. Been going on for years, only now it's hitting the radio community. Like pulled over for speeding out of state, even though you weren't. You are on your way home from vacation, are you going to return to the state to fight a ticket for less than a hundred bucks?

You are probably right about the 50 watts but assuming the receivers are expecting 2.5 KHz deviation, the 5+ common on the ham bands would simply sound like unintelligible crap. An awful lot of confirmed AMers are going to learn the hard way that FM is a receiver-dependent mode. Now you know why CB is FM in a lot of places that went to it when 10KHz spacing became possible (standard FM spacing in 1958 was 50-60 KHz); over-deviation is not only useless, it is counter-productive.

Power mikes, echoes, and the rest of the schtick on FM are about as useless as a third tit and not nearly as decorative.

your cb don't know background noise from signal , if you have a better recieve you get everything . there are some cb's and add-on's that claim to cut only the noise , i have seen one called "the noise chopper" my friends said it stunk . cobra has something that claims to reduce noise , but i have never used one . maby someone in the group has used a radio with it , and can comment on it.

OK Guys,

I am new to alot of this. I have had a CB for quite some time. Just recently I have inquired about some things from this NG because I am litterally quite ignorant about alot of these issues. I decided I wanted to get a HAM license, I have wanted to for awhile but the recent change in the dropping of the Code test really gave me incentive. So I started looking around on the web checking out sites referred to me by members of this group. Anyway I downloaded the Q&As for the tests and ordered the first book from the ARRL web site to start studying for the Technician test. Now to my question. I was looking for a mobile radio to get started with. Well as I do most things I figured I would just spend the money up front and get a good radio instead of a R.S. model to get by. I checked out the radios at Export Radios and liked what I saw with the new Rangers. I thought I may go that way. Now I am reading this discussion about Export Radios being questionable as far as the FCC is concerned. Do I need to stay away from these ?? If so what do I go with? I do not want to break the law even if I am the only one who knows it. What do I do? Thanks guys.

Dave

I am selling four (4) Amperex PQ 7534 tubes. These have just been tested for emissions and leakage on a B&K 667 tube tester, and all test strong. They are used tubes, but show no physical sign of hard use. I donï¿½t have any equipment that uses these, so I canï¿½t verify that they will work in any specific application. I will warrant these tubes against DOA, and that they will test good on a similar tube tester, but otherwise the buyer accepts these tubes ï¿½as-isï¿½.

All 4 for $75, (shipping included for US).

If interested, please respond by email.

Regards,
Tom Mitchell

1st off..... the FCC didn't DROP the Code requirement.... they LOWERED it for the higher class licenses (to 5wpm). Although Code is NOT required for the Technician class license (only a written exam), it is STILL a requirement for Amateur HF operation below 30Mhz..... in order to LEGALLY use that Ranger you were looking at, you'll need to pass a 5wpm code exam too (even then you'll only be able to use it between 28.1 & 28.5Mhz... ONLY in CW, digital, and SSB modes, NO AM or FM)

> Now to my question. I

> liked what I saw with the new Rangers. I thought I may go that way.

The price on the RS 10m rig is hard to beat, but it IS a compromise radio (only FM and SSB)... as an operator who likes to fool around with many different modes, I personally wouldn't buy ANY radio that's not an ALL-MODE rig... CW/SSB/AM/FM/FSK. And further..... for what you'll pay for a NEW Ranger (or some of the other 'export' models, $100-200 more'll buy ya' an ALL-BAND (160-10m), ALL-MODE, 100 watt rig (granted, it'll be a used one.. not new).

BTW........ good luck on the exams!!!!!!!!!!!!!!

Message-ID: <8qckn4$6o9$1@nnrp1.deja.com>
Source record: 52753

Ok,
I seperated the braid from the core lead.
Noise is back, will get to that.

My ground wire is about 4-5" long.

On the noise, I switched from the seperate choke/capacitor 4 amp filter setup, $3, to the $15 4 lead, no diff.

I can eliminate the noise, but only with squelch at about 40%.

It is a combo of ignition (hei on chevy) and fan moter since you can't turn the wonderful thing off.

Will go to resitor plugs and shielded wires if need to, pain since just put new wires on 3 months ago <G..

Will have a shop do plugs as these babies are only 12k old, but also 15 years old from when rebuilt while was Dads truck, only got about 2-500mi a year on it till 2 ago, so I suspect they are rather well seated <G..

On the fan noise, is there a way to make it so you can totaly shut off a GM fan?

IF not, will running power and ground leads for unit direct from battery help, or do I have to roof mount the unit?

Hoping to stay floor mount if possible.

I did, after fixing the whip wiring tonight manage to sorta talk with someone, but couldn't get a range check as they could hear me clear but they came in real garbled, could only make out about 1 in 8 words.

This was in an area ranging from on top of the hill, down to bottom and back up the 213 bypass in Oregon City, OR in case any of you are in that area.

Will be doing a short (1/4mi) check around noon or 2pm with a guy that works dayshift where I work Thursday, will let you know how it went and update things around this time thursday night if dont make it by here at my lunch break.

Thanks for all the help so far, I *am* gonna get this thing working <G..
Ron

(ps: anyone notice that the word "liniear" seems to get funny looks at radio shack when combined with a whip spring on the counter? Couldn't resist asking about one just to see if they'd react like I suspected,

they did <G..)

The D104M6b sounds excellent on the DF.
Two things you can do for the noisy rx, three if you have an early model.
Early models had an incorrect filter in the IF stage, RF Limited will send you the replacement.
The whine you get with the volume all the way down is through the power wire, a line filter or some caps on the power lead will cure that.
Finally, the "Channel Guard" (TM) will help with the rejection.
Too bad RF didn't (hasn't) cured these problems, but cool radio anyway, and they're selling. They'd sell alot more of them (truckers) if they'd cure these problems.
Wm.

Plugs and wires will help. GM's HEI is a real bastard to get clean,
but it can be done.

As for the fan. You can solder a capacitor across the power terminals
on the fan to help filter out the noise. I don't recall the value of
the cap. I've never had to do it (not even in my '81 GMC pickup I used
to own). I'm sure someone here on the group could make some
suggestions. Of course, that means you'll probably have to take part
of the dash apart to get to it. If you really want to run a switch to
turn it off, that would be a good time to do it.

The power filter you put in was the Radio Shack brand? I've always
gone out to the truckstop and bought the Deisel brand ones. They work
very well for power filtering. But you've proven that the noise is
coming in thru the antenna, so power filtering isn't the problem.

While we're talking about it, have you checked the SWR of your antenna
system? It might be a good idea to throw a meter on there and make
sure its safe. What's "safe" varies from person to person. I
personally believe anything below 2:1 is safe. Others say 3, others
say 1.5, etc. Of course, getting the SWR as close to 1:1 as you can,
on all 40 channels, is ideal. That's another can of worms, especially
with the firestik you have.

If worse comes to worse, and everyone still sounds garbled, etc, on
your receive, it might be a good idea to take the radio to a qualified
tech for a tune-up. Tell him/her the problems you're having with the
noise from your ignition and fan. He may have suggestions the others
here and I haven't thought of. Also make sure to tell him you would
like the radio loud, but clean, and not overmodulated.

Oh, when you walk in, ask the tech if they have an oscilliscope. If
the answer is no, grab your radio, turn around, and walk out. Any tech
worth their salt will have a scope, and will use it to tune your
radio.

Hope this helps.

As previously stated, the no-code Technician license will get you 6 meters and up. 10 meter operation requires code competence. Look at equipment manufactured by Icom, Yaesu, Kenwood, and Ten-Tec. These companies build 95 percent of the commercially manufactured transceivers used by amateurs. Radios such as Ranger are CB radios, regardless of how they are marketed. Their resale value in the ham community would be nil although resale in the CB community would be much higher. Very few amateurs actually operate HF mobile. Of this group, very few of them would be found operating strictly 10 meters mobile--perhaps a holdover from the pre-April 15 date when the Tech Plus license was good for 10 meter operation but no lower.

The Hy-Gain "slider" was designed to plug into a jack in the rear of
certain Hy-Gain radios. When activated, it allowed the RECEIVER to tune
through the bands. Since, out of box, it did not allow VFO on transmit,
it was considered legal. However, cutting just one wire inside allowed
it to function on transmit as well, which is what most people, who owned
them, did. But THAT was definitely NOT legal.

6273. Re: Delta Force Mic Alternatives?

Newsgroup: rec.radio.cb
Date: 2000-09-21 00:00:00 UTC
From: Miles Davis <MDD327@AOL.COM>
Message-ID: <8qd5ps$9tg$1@nnrp2.phx.gblx.net>
Source record: 52764

My Delta Force was purchased in june of this year and I'm not sure what version it is. I use it in my suburban and find that I have a background noise level that is way too high. The fact that I run the mike audio knob at around 7 o'clock (it can go to 5 o'clock) tells me there is more audio than I can use. I know there are at least three radios known as Delta Force and yours my be different than mine but, a D-104 is the last thing I need for mine. I plan on getting a noise cancelling mike and using the radio to bring the audio level back up to normal. If this does not work then I'm back too the drawing board!

>is limited to 2.5khz, but someone runs 5khz, and the receiver is
>capable of understanding and decoding that much deviation, the 5khz
>deviation radio will be "louder" than the 2.5khz one......."
THAT's the big "IF"-- if the receiver is capable of "understanding" 5Khz deviation.....Many FRS radios are designed for 2.5 xmi & rcv, & many Hams complain that their modified ham rig is distorted or unintelligable on an FRS radio unless they talk soft or "back off" from the mike. Turning up the deviation on an FRS (or the new MURS) radio is probably not a good idea unless the primary use would be to communicate with non-2.5k rigs, such as GMRS or commercial/Ham gear.......I know someone that turned up the deviation in his FRS... It was no problem & sounded better talking back to his Maxon GMRS radio...but when he went camping with a few people that all brought FRS rigs, he was the one with the almost useless "distorted audio" radio.....

6275. Mulitple Antennas on a Vehicle???

Newsgroup: rec.radio.cb

From: TW&#65533;
Message-ID: <t4py5.234192$i5.3161098@news1.frmt1.sfba.home.com>
Source record: 52766

Yesterday, I was driving to work and saw a pickup that had a Tram Skyhawk antenna mounted on the toolbox. As it went by, I noticed that it had about 6 different stainless steel whips mounted on the tailgate. All were different lengths. None were over 4 or 5 feet tall. What are these used for? Are they used for like beam antennas?

if anyone in the group has put that channel gaurd in there delta force ,
please tell me how it works .

and i am pretty sure a d104 would squeal constantly , since you can never turn
the talkback 100% off .

and i too have more audio than i need , i keep my mic gain about 10 o'clock ,
and i am loud .

i saw a funny thing on mine , on band J , i have 44 channels . kinda wierd ,
wonder if they are all like that

Good point Tim. There is a good reason why broadcast studios are padded
cells.

In the olden days, most mobile mikes were carbon -- like a telephone. Kept
the frequency response neatly in the 300-3000 hz range and were so
insensitive that traffic noise, etc never had a prayer. Worked good.

Dick

<snip>
> Very few amateurs actually operate HF mobile.

... that may have been the case a few years ago when rigs were larger and harder to install in vehicles, but with the advent of the smaller rigs and remote head rigs (TS50, FT900, IC706, FT100, etc, etc), mobile operation is becoming far more common. In my local club of over 250, we've gone from just a dedicated few mobileers to well over 40 who are now HF mobile & portable on a regular basis.

> Of this group, very few of
> them would be found operating strictly 10 meters mobile------

.....Not if the DX is running strong!... although for LOCAL (city/county/area-wide) communcations, you're right, very few use 10m (VHF and UHF serve better).

> perhaps a holdover from
> the pre-April 15 date when the Tech Plus license was good for 10 meter operation
> but no lower.

The 'old' Tech Plus (pre-April) offers EXACTLY the same priveleges as the 'new' Tech license (WITH a 5wpm code certificate). A Tech with code has access to more then 10m as well.... with CW privileges on 80, 40, &15m (in what were called the 'Novice' bands)...all bands that allow county/state/country/world-wide communications. The only difference between the 'old' and 'new' Codeless Tech licenses is the written exams..... you now take one instead of two.

"TWï¿½",
It's almost impossible to tell what freq/band an antenna is for
just by length. I would suspect that they were for different bands.
The likelyhood of having a beam antenna on a vehicle is pretty slim.
(Not impossible, but why would you want one?)
'Doc

PAL 321 forsale. All (4) 8950 tubes checked good anywhere between 90-95%. Puts out about 200-250 watts off my Cobra2000 with a 3.5 watt carrier and 20 watt pep. I've seen this unit do more off of my AR3500 with a 4 watt carrier and a 55 watt pep (around 350 watts or so). Excellent driver for a big box or use by itself.

Selling for $250.00 firm just for the cost of re-tubing this unit. I'll even throw in an extra 8950 for shits and grins. Email me if interested and thanks for looking.

Twisted,

I'd be out $1200.00! You damn tootin' I'd go to Indiana to fight for that! I used to go to Indiana often (family), but I never had any trouble over my antennas. Passed quite a few cops, too. So it's probably not as bad as it sounds. I know that (thank God), here in NC, we don't have any "Scanner Laws" that I am aware of. Makes me glad to be a Tar Heel! LOL!

Jerry

6305. FA Uniden Madison SSB Base w/Turner 3 Days left!

Newsgroup: rec.radio.cb
Date: 2000-09-21 00:00:00 UTC
From: dekanblue@aol.com
Message-ID: <20000921183520.14036.00000170@ng-fn1.aol.com>
Source record: 52796

LAST 3 DAYS!!!!

The Uniden Madison SSB CB Base Station is a STOCK, 120 Channel radio. 40 AM, 40 LSB, and 40 USB. The radio features a Digital Clock, Automatic Noise Limiting, SWR, RF Gain, Mic Gain and more. The radio is being sold with a TURNER PLUS THREE POWER DESK MIC. The radio comes with Huge External SPEAKER.

This operation of the radio is PERFECT. It has only two slight cosmetic issues. A few light scratches on the plastic trim and some small stains on the top of the case.

It has been packed away for the last seven years and cannot be set up because of "no external antennas" policy in my Condo. Make my lose your gain.

I will ship anywhere in the lower 48 for $20 (buyer pays). Good Luck and Happy Bidding.

Yea, I'd fight for that too. But you must admit, 1200 bucks is not the cost of the average radio or scanner on the road.

I am selling an amp from my uncle's estate. I have had this amp for about 5 yrs. now. I got it from my uncle estate, he in which bought it new; so it has been in the family since it was new. I don't know exactly how much my uncle used it, but I know it wasn't much. I guess in the five yrs. that I have had it, I have put maybe 40 hrs. on it (most of which were at idle). It went three yrs. sitting in my closet. It is in good condition and I would guess the tubes to be still around 80-85%. It uses four 8950's (I believe two matched pairs). It has plate and antenna tuning controls and a bias adjust on the back panel. As far as power out, it puts out around 300 W on AM and about 500W on SSB (that is on high drive of course). The inside is clean and the front face is almost mint. The only cosmetic blemishes are on the cover which could easily be repainted to make the amp look mint again. I will only ship to the U.S. and the tubes will be shipped separate. I will guarantee the amp not D.O.A. as long as the buyer pays for insurance. I don't really know what the amp is worth, so I am going to take offers for a couple of weeks. I include a link so you could view some pics of the amp. Thanks.

J.R.

Linear Amplifier

6309. What's it worth?

Newsgroup: rec.radio.cb

Cobra 142GTL with following modifications:

1. Clarifier modified such that transmitter tracks with receive (no additional slide).
2. AMC adjusted to achieve 100% modulation without overmodulating.
3. MB8719 PLL removed and replaced with Redco Digiscan UFO. (25.999-28.000 in 5KHz increments). Original PLL included.

All other adjustments/components are stock. Standard 5W AM, 12W SSB.

In my manual it says that inside the mic there is a pot to adjust the mic output, maybe that would be helpful to you for the background noise problem.

The reason I curious about the D104 is not really because the radio needs more modulation or anything. It is plenty loud. I just really like the punchy tone of the D104. From what I can hear the stock mic is a little bassy.

How would running an amp too "hot" cause resistors to fail?
Solder would melt before resistors would go bad.

It seems that the professor has a lot of "book" theory. I don't blame the man for trying to make a buck. The reason he no longer posted his homepage under his signature is the fear of the flames that he would most defiantly receive. I believe that the flames come because he sometimes puts his feet in shoes that are way too big for them.

>From: k8cpa@arrl.net
>Those so-called amps are harmonic generating pieces of junk.

I think you may be surprised were you to acually test an X-Force XT400 on a spectrum analyzer. They're alot cleaner than you think.

>Get a real amp, like a Alpha, Henry or Drake, then come talk to me
>about power!
>A friend of mine has thier "Sweet 16" in this car.... I could step on
>him with something with a pair of 3-500Z's in it all day long! >

Not many people (that I know of) run base tube amps in their cars, and Texas Stars are much "dirtier" amps than X-Force or Daves.

I keep
>asking him to let me bring over my buddies BIRD watts meter and see
>what the amp REALLY does..
>(might be becuase his so called 1600 watt amp does about 800 watts on
>a GOOD DAY!)

A sweet 16 run at stock voltage may do 600 bird.

Say, I've been catching some faint tx's coming from a "mod squad" over
on channel 6 or 11 (can't remember which).

I'm out here in Oregon, don't know where it's coming in from.

Where, and how does one find/buy linears at?

Got a guy at work who isn't on net trying to find a linear or
preferably a bi-linear mobile.

Thanks
Cougar

6329. F.S. Uniden HR-2600, Connex 4800 DXL, Texas Star 359 and Boomer 250

Newsgroup: rec.radio.cb
Date: 2000-09-22 00:00:00 UTC
From: Darren Ream <reamesq@swbell.net>
Message-ID: <39CB573C.E0AA1DC2@swbell.net>
Source record: 52830

New baby (and wife) forces sale!
I have the following equipment for sale:

1) Uniden HR2600 with Chipswitch installed. This radio is the same as the 2510 but has an RIT on/off switch in place of the PA switch. It was manufactured after the 2510 and was supposedly "11 meter mod-proof" and designed for hams only. The Chipswitch mod however allows use on 12 meters through 10 meters (24.500 - 29.999 mHz) as well as adds other features such as scanning, split operation and a host of other programmable features not available on the 2510. Works perfectly. Near new condition, little used, never mobile. Comes with mic, bracket, power cord, original manual (including for the
Chipswitch) and box.
-$225 shipped Conus
2) Connex 4800 DXL. 12 through 10 meters. Export model. 40+ watts output. Brand new, in the box. Extra cost power tweak, frequency alignment, and clarifier unlock performed by Left Coast Radio. Service manual and schematics included. Paid over $380 3 months ago.
-$325 shipped Conus
3) Texas Star 350 HDV (High Drive Variable). 2 x 2879's. Designed to be driven by 15-30 watts. Perfect for either of the above two radios. Brand new, in the box. Never used except once to verify operation.
-$185 shipped Conus
4) Boomer 250 Deluxe High Drive. 2 x 3749's. New, in the box. Adjustable power settings.
-$110 shipped Conus

All of this equipment is in top shape and the best you will find anywhere. Always indoors in climate controlled environment. Never around cigarette smoke or bumped around. If any items are not as advertised, I will refund your money (less shipping back to me). This equipment has not been tinkered with and is fully stock condition unless

otherwise noted.
Feel free to e-mail me with any questions.
-Darren

Disclaimer: Some of the above equipment is illegal for use in the U.S..

Buyer is responsible for complying with all laws in his jurisdiction.

Hell guys, this is worse than Radio Shack.

I don't care if someone sets up a dummy hotmail and runs *that* through an anon remailer, all I'm doing is trying to help someone out and have discovered that search engines find some info, but nothing I can sort through being less than CB literate for now.

Narc no less! HAH! If you knew what the boys in blue out this way were like you'd have a hard time believing anyone would assist them with what time of what day it is, it's starting to remind me of New Orleans out here <G..

#&@^, if I was a narc instead of a plain ole machinist dn't you think I'd be able to afford something better than the little realistic I been totin around for 10 years? <chuckle> Hell boys, my friend has a better rig than me, and his probably works about as well as a 2 way crystal radio kit for 7 year olds LOL

Why did Uniden stop producing these radios? Where on the net can one find the list of features? Were they exactly like the Lincons? IF so It looks like they may not have a RF gain adjustment, do they?

thanks

Well cowboy, I dont understand why DOA warranty and good working condition would contradict each other. Lamen terms- It must work.

As to your pricing idea, used pieces are all over. I have looked at many TS, messenger, and pals in my price range most over 250w

It is definitely a buyers market, I dont see how anyone would buy a 4 pill unit that doesnt work for $200???

both the ssb and am/fm , have a 10.695 IF filter on it , and th am has a 455 also .

the guy at CBC intl. told at me that the way the delta force is wired you cannot have a single channel gaurd on all modes or the Nb/anl will not work . (don't know if thats true)

channel gaurd has a 10.695 , so that will work at least on AM , maby on SSB also , dunno , haven't actually talked to a tech about it yet . if someone knows about this please post on it .

From: "Ramon V. Samson" <rvsamson@vcn.bc.ca>
Message-ID: <8qgdbdbm1@sylvester.vcn.bc.ca>
Source record: 52851

Hi,

I have a Cobra 29 LTDST with a Solacon 43-in mobile antenna (whihc you have to twist a ring at the base to adjust for min VSWR). Lately I noticed that intermittently, my VSWR which is very low normally, goes as high as more than 2:1. I tried wiggling the cable expecially near the ant base but could not duplicate the condition. I remember that I had another radio before and intermittently the VSWR also appears to be high onn the same antenna.

Has anybody had the same experience with this antenna? I suspect it has something to do with the base/ring assembly (what is the rpinciple in this?)?

I would apprecaite anyn tips or advise.

They're about equal, the FT-2100b having slightly more power. What
I'd look at is the replacement cost of the tubes. Don't know what
either one is going for right now, but the AL-811A may have the 'edge'
there.

TH,

LOL! Now you know why I'd definitely be a-fightin'! It's an Icom 706
MKIIG with additional filters, etc. Unfortunately, it has to meet
NTIA standards for US Gov't operations. The rig alone was $979. I'd
fight over that, too!

>New, used whatever, must be in good working condition with DOA warranty.

A slight contradiction of terms here gentlemen. I want it warrantied that it will be DOA, but in good working condition.....hmmmmm. Well fellow radio junkies, we all know what he meant, but for that kind of money you aren't going to get too much bang for your buck. I have seen some used 4 pills for $200 that needed a few resistors replaced because they were run too hot, but for $150 you might be able to sweet talk some poor serf out of a decent 2 pill if he didn't know what it was.

The only other suggestion I have is try to find a "Misquito". That is a 1 pill modulator that can get you around 65+ watts with a relatively low dead key. You could then use this same gadget if you ever got a custom made high drive.......

But using the fishing hole analogy, as far as the other services who
use the "off" frequencies are concerned, those fishing holes are
polluted and or dry. The military doesn't use them because the
propogation sucks(its too unpredicable) The few commercial channels
are not in use due to lack of equipment and interference due to
skywave and those $%#$Q% mexicans. Therefore, the freebanders are
basically using somebody elses trash.... the FCC is the only one
that cares because Riley has a (cow) chip on his shoulder and likes to

wave his stick around like he's doing something.

Who cares what you think?

Those so-called amps are harmonic generating pieces of junk.

Get a real amp, like a Alpha, Henry or Drake, then come talk to me
about power!

Same goes for Texas "stepped on" Star

A friend of mine has thier "Sweet 16" in this car.... I could step on
him with something with a pair of 3-500Z's in it all day long! I keep
asking him to let me bring over my buddies BIRD watts meter and see
what the amp REALLY does... he keeps avoiding me... Gee, I wonder why?

(might be becuase his so called 1600 watt amp does about 800 watts on
a GOOD DAY!)

hehehehehee.... I love being the pin that bursts people CB Radio Head
bubble!

Once you let out that TEN OHM SMOKE, the pills are bad!!!

6386. Receive amps and filtering

Newsgroup: rec.radio.cb
Date: 2000-09-23 00:00:00 UTC
From: Mario Mitchell <OS@Freedom.usa.com>
Message-ID: <39CC6C66.4E0FF4E8@Freedom.usa.com>
Source record: 52892

Got a few questions regaurding receive amplifiers and filtering.
First off, how does a receive amp amplifiy the incomming signal and not over power the Radio used such as when you are close to someone and they key up and nearly burn your radio up? and second how does a receive handle
such an event.

also the noise.
does a receive amp amplifiy all the noise that comes into the radio or does it have
many stages of filtering and band pass filtering in it. What is a low pass filter used for?

and last.
What are some brands of receive amplifiers and pre amps and where can I find them to look at and do my research on.?

This is for 20-40Mhz band.

thanks
Reply by email also plz.

My dearest chuckie boy #1 asshole you can call scotty and ask him
yourself , i have not seen or have talked to scotty in about 1 year
smartass , #2 I dont know where you get your info from chuckie but as
always your dead wrong again as you put it asshole. , #3 if i where
you i would not brag to much about your fucked up peice of shit
general ticket one phone call and it will go as fast as it came dick
weed. #4 it's asshole ham guys that give the rest of the guys a bad
name . you should go shoot yourself, moran, duh duh duhhhhhhhh.
#5 chuckie if i dont know how to repair radios them why am i still in
business and you are not , and who is the person sitting at the bench
will all the customers standing behind them watching them getting
their radios repaired duh duhhhhh. . it sure is not santa clause.
#6 chuckie everyone on this NG knows what you are all about and what a
big bull shiter you are , go lay down you little troll.
and last but not least to all the other ham guys out here , the good
one dont take this to heart but ol chuckie boy and all his so called
butt buddy ham boys and the fcc, cia, fbi, naacp the mgb.and so on
,you all can be stuck right up chuckies big ol fat ASS
So chuck you had better go recheck your fact's again and you sure will
be surpized haaaaaaaaaa haaaaaaaaa
nuf said for the moment.
have a good day

Source record: 52896

>>>Got a few questions regaurding receive amplifiers and filtering.
First off, how does a receive amp amplifiy the incomming signal and not
over power the Radio used such as when you are close to someone and
they key up and nearly burn your radio up?<<<

answer : turn it off when someone close is talking , if anything the amount of
gain makes then very hrd to understand , as for harming the radio , dunno .

>>>also the noise.
does a receive amp amplifiy all the noise that comes into the radio<<<

recieve amps amplify everything , signal and noise .

>>>What is a low
pass filter used for?<<<
low pass filter is often used on base radio's when the neibors complain of tv
interferance .

>>>What are some brands of receive amplifiers and pre amps and where can I
find them to look at and do my research on.?<<<

RF limited is who made the one i got . i think the site is ... um ......
rflimited.com

Hello Cat: I'd go with the Yaesu 2100B. Its a time proven amp, and the tubes are still available. I put a fan on the top of the unit to help remove the hot air.

Adjust the 10 meter input tuning adjustment in the back of the amp for max output on your frequency.

Jay in the Mojave

Source record: 52904

FS: Texas Star Sweet Sixteen (8X2879)
clean amp, little use
Internal wiring upgraded (very nicely done)
with Texas Star ModV Plus
$525 shipped CONUS

6399. FS JoGunn 3+3 Star 3 element Beam

Newsgroup: rec.radio.cb
Date: 2000-09-23 00:00:00 UTC
From: ftoe <ftoe@home.com>
Message-ID: <uK3z5.2505$P82.140672@news1.rdc1.ct.home.com>
Source record: 52905

FS: JoGunn 3+3 Star 3 element Beam
Is used, but in very good condition
Includes a machined sleeve to reduce mast diameter to 1 1/2"
also have instructions.
$180

Here are the specs
TYPE: Horz. & Vert. Polarization Twin Feed
GAIN: 14.5 DB
FRONT TO BACK RATIO: 40 DB True
SIDE REJECTION: 40-45 DB True
BACK REJECTION: 40 DB True
WEIGHT: 28 lbs.
LENGTH: 8 feet
SWR: 1.1
HORZ. to VERT. SEPARATION: 20-25 DB
WIND SURVIVAL: 100 MPH
POWER MULTIPLICATION: 40X
AUDIO GAIN: 18 DB
WIND LOAD: 2.8

The guy stated that running an Antron is the problem, isn't it.
I answered, no.
Show me where I misstated, or gave a wrong answer.

Someone besides me said.

Sometimes they are overloaded and the radio does not "handle" it. This is when you switch it out of the circuit. All amps also produce noise. Hopefully the external amp ypu add will produce less noise than is already in the rx and adding it will improve your signal to noise ratio. Unfortunately this is not aways the case. I recently tried a Hamtronics amp and it made an improvement on my rx.

Mario,

Preamplifiers are not all created equally. The gain, in dB, is of primary importance of course. To answer your question though one would need to know the -compression point- of the preamplifier this is usually measured in dB or dBm. Not too surprisingly, better preamplifiers have higher compression points. If a compression point is reached by an undesirable signal, it will effect the desired signal severely, to the point of it being difficult or impossible to hear. Will it damage your receiver? Probably not - unless the preamplifier has enough output energy to damage the first RF amplifier in the radio.

If someone with a powerful stations keys up beside you it is possible that they will damage your receiver. You'll know it though. Receivers don't normally go -soft-, they either work perfectly or pathetically (after they've been damaged). There are low-cost diodes placed in the receiver path that exist to protect more expensive components.

Receiver amplifiers amplify anything that is within their pass band - inlcuding noise.

A low pass filter is normally used to remove 2nd order harmonics from your transmitter. In the case of CB, the operating frequency is 27MHz so the 2nd order harmonics will be on 54MHz - channel 2 on NTSC televisions. Low pass filters are normally a waste of money on a stock CB setup but beneficial when using an outboard amplifier. Single-device amplifiers are notorious for 2nd order harmonic products. The name -dirty boot- is well earned.

Motorola makes some receive preamplifiers, but all the ones I've used have been constructed either by myself or others. Thankfully, 27MHz RF circuitry is quite forgiving for hobbyist designers.

MC

Tim,

How can you think that is funny? When you and I have disagreed, it is about this very thing (for the most part). Do you know what the Maritime Mobile Service Net is for? It is to assist mariners and military personel in getting traffic to the states, and to assist boaters in trouble. On one of those nets, I listened to a yacht shipping water in heavy seas off the coast of S. America. Thru the efforts of those "old geezers", as you call them, help was rapidly deployed. The boat was taken under tow and the people were saved. To interfere with such legitimate communications is criminal, and people who interefere with nets should be prosecuted to the fullest extent of the law!! Our communications regulations aren't perfect, but they are designed to protect necessary and useful communications, as well as permitting the maximum use of the spectrum for such business AND personal business. I find it hard to believe that a mature individual would find such interference amusing. It is NOT funny! And the fellow who is doing that today WILL get caught if he keeps it up.

We had a case of malicious interference on a local 2 meter repeater just last night. Seems someone "locked" down their mike and kept the repeater transmitting for 3 hours. People who do this thinking they can not be found are just plain stupid. Three of us with beams triangulated the location within 2 miles. Other hams took to their mobiles and, using portable DF equipment, narrowed it down. They followed the signal right into the guy's driveway! As soon as they saw the cars, the signal "mysteriously" went away. Wouldn't answer the door, either. Hmmm. Wonder why. It's up to the authorities now.

So the people who do this needn't worry. They can get away with it for a time, but that's all it is--a matter of time.

Jerry

Yeah,

But I betcha those truckers won't tell the US Marshals to "go pound
sand". Don't believe it? Just ask William Flippo ("Rabbit Ears") of
Jupiter Farms, Fl. what happened to him. Go to www.rainreport.com and
read the letters. Mr. Flippo operated on 10 meters and received a
Notice of Liability for $20,000. He ignored it. FCC, US Marshals,
and local law enforcement went to Mr. Flippo's home and "invited" him
to visit their facilities---uh, rather insistently, I understand. He now
faces the $20,000, plus $10,000 per offense, and up to 4 years in jail.
They might not catch you right away, but they WILL catch you. My ques-
tion is: is it worth it?

Jerry

Well Thank you that clears alot up.
and as far as say I did get damaged by someone transimitting to hard nearby I could
alway replace the diodes, if that is the only thing damaged or even minor damage as
I am also an electronics hobbiest with studies in anolog currently.
I was looking at my Galaxy 250 and I does have a pre-amp and in the last day or
so of owning it I found out how to receive better then just the radio would by tuning the rf gain just right.
Although I can only get around 150 Watts from this 250watt Galaxy, why is that?
I thought I checked to make sure it was a low drive and my President P220 runs at around 4.5-5watt.

<< Hello Tim: Good one that pulled Don out of the wood work big time.

Jay in the Great Mojave Desert>>

Funny you should mention Don. I was on 10 meter AM the other day and answered a CQ from a K4KYV in Woodlawn, Tennessee. His name was Don. We exchanged signal reports and talked for a while about10 meter propagation, boatanchor AM rigs, and whatnot. There were no breaking stations or any QRM to speak of. My output was about 30 watts. His was, I believe 100 watts. Neither of us used echo mikes. There were no threats, vendettas, or profanity involved. It was all completely squeaky-clean legal. We didn't rais our voices to yell, we just used normal tone of voice, so I guess you could say we talked in a monotone. Now this may sound rather boring to you, but we both enjoyed it immensely. It was only later that I realized that I had just spoken to the guy that you think I am. (What a concept. LOL)

6437. APPLICATION FOR AMATEUR RADIO LICENSE (FCC FORM 605"dd")

Newsgroup: rec.radio.cb
Date: 2000-09-23 00:00:00 UTC
From: "Scott (Unit 69)" <upplus@hotmail.com>
Message-ID: <39CD4E32.F36AB637@hotmail.com>
Source record: 52943

APPLICATION FOR AMATEUR RADIO LICENSE (FCC FORM 605"dd")

NOTE: FCC Form 605 will not be accepted after April 15, 2000. Please use forms with the "dd" ("dumbed down") suffix after that date.

Your name (or mark):
Your street (if unable to write, attach pictogram or map with red "X"):
Your city:
Your state (choose from drop down menu if testing on-line):

Are you in Florida or California ?

If you answer "yes" to the above, would you consider getting licensed in Canada or Mexico to reduce the FCC's callsign allocation burden for these two states ?

I am applying for (circle) :

No-code, quasi-Marine VHF ticket
General Radiotelephone Permit
Formerly "Extra Class", now "No Class"
Political Asylum at ARRL as a holder of a former UA or RA license
(please attach license or contester testimonials or your "character")

I have (circle all that apply):

Memorized all queries and answers
Paid for ARRL Life Membership in cash
Bought a new Voice only CB from YaKenComSu and found this form inside
Donated to WB6NOA's Publishing House
Bought off my W5YI Examiner
Amassed over 1500 Hours on the SETI screensaver

In case of electrocution from the 1500 watt amp you have will no knowledge of the workings of, give name of next of kin (not related by inbreeding):

Do you participate in any of the following ?

Web server hacking (attach references from N6NHG or FBI)
Bass fishin' Skeet shootin'
Yugo parts Swappin' Gremlin Refurbishin' Gas Passin'
Smokin' (Reefer, Cigarettes, Crack pipe ?) Microphonium Solderin'
Scanner listenin' Wire phreakin' Antron 99 Modifyin'
Monster Truck Rallies Weather Watchin'

Do you live in a :

Cadaverlac School bus Parents' Cellar Apartment
VW Beetle Van Mobile home "Big Rig" Duplex
Dunkin' Donuts (while open ?) Burger King (while open ?)

If you live in an apartment, why do you want a welfare incentive based ham license ?

Can't afford college or technical school
Think generating TVI is cool harassment tool
Radios don't bitch like girls do
Want to play State Trooper when mobile

Does the value of your tower exceed the value of automobiles registered in your name ?

Does the value of your CBs and scanner equipment exceed the value of your present dormicile ?

Are you :
Married
Divorced (Once Twice Thrice)
Gay (please apply for "Satellite only" license)
Lesbian (please apply for "CW-contest-only" license)

NOTE: If you circled Thrice, please attach statement indicating you have not participated in a SSB contest in the past 10 years)

Does your wife's hair present an electrical fire hazard ?
Does yours ?

Does your wife's hair present a hazard to Al Gore's campaign platform ?

> making my case.

....Wasn't exactly trying to prove your point, but that 40 or so who are now HF/mobile is a far cry from what used to be only 5 or 6. ....the POINT I was making was that with rig-downsizing of the last few years (more to come), more and more are doing the 'mobile' thing.

A possible explanation could be that you are using a
pre-amp with a mis-adjusted/tuned input. This can cause
a unwanted self resonant condition. This will allow you to
hear oddball frequencies that you are not tuned to.

Are you using a pre-amp? If so turn it off and check it again.

anyone out there know how good those radio shack hand held freq counters are. From what I have seen you just hold it next to a transmitter and it gives you a reading. Plus how close do you have to be to the transmitter. I thought about getting one just to find out what freq the big shots at work talk on. cant carry a scanner to work and scan for them. That would get me fired.

Hello Ham 4 Fun: I stock 6060-T8, .058 wall thickness aluminum tubing
in these sizes:
1 1/4"
1 1/8"
1"
7/8"
3/4"
5/8"
1/2"
3/8"

And 3/8" aluminum rod. Which fits into 1/2" tubing.

And could probably beat the price of $50 dollars per replacement of a
pair of elements.

What are you asking for the amp? I remember that amp verry well. Is that
the moble amp or the base? Think the b was the base amp.

FYI. Ameritron builds the AL811 and AL811H. It has never built an AL811A. Both amps use varying numbers of 811a tubes, hence the confusion. This tube is no longer manufactured in Russia and the Chinese version can't be run at full output. It is advisable when retubing an AL811 to use 572b's. Given the lower voltages of the AL811, this tube should last for decades.

A modest and most importantly CLEAN 30 watt deadkey with a
swing to 100 with a stock 3 watt output radio. Would do more with
a double final export that would key at 10 and swing to 30watt thus
producing a higher deadkey and swing out of amp! Nice amp for
neighberhood happiness.

I don't know why they stopped making them. You can see the mods available for each at the site listed below, which will give you some backround into each one. The 2510 did not have the CTCSS tone to access repeaters on 10 meters. The 2600 and the Lincoln did. Both the 2510 and 2600 have the RF gain (receive) adjustment, the Lincoln had a varible RF power (transmit) instead. The 2510 has a roger beep, the 2600 does not. The Lincoln has three colored buttons. The 2600 has an on off switch for the RIT. Get a Chipswitch installed if you get ANY of them. Be aware that on the links below, there is no actual picture of a 2600, they use the Lincoln pic instead. The last link has an actual photo of a 2510.

Gary,
Your right, the 572b tubes would probably last forever. But
there's
a problem when you do that, two problems depending on how you look at
it.
First, power output would be nowhere near the 600 watts rating when
using
811a tubes in that amplifier. The second is that running the 572bs at
a plate voltage of around 1500-1700 volts makes the amplifier 'mushy',
the
tubes are being run at less than normal efficiency. The tubes are
being
run at less than normal linearity, producing a crumby signal. Been
there,
done that, and quit while I was ahead by going back to 811a's. (Serial
Number 13, by the way.)
To use 572b's in an AL-811 correctly, your going to do more than
just
swapping tubes. With the 'buck-boost' transformer in the AL-811, it
isn't
difficult to 'bump' the plate voltage to the 1900-2400 volts needed
for
the 572b's. Then reducing the filament voltage to the normal range.
It
would also call for replacing a few capacitors because of the higher
voltage ratings. Ain't worth it...
As long as Ameritron produces the AL-811 or AL-811H, they will have
a
source for tubes. They are happy to be your source for tubes, too, so
don't
worry it.
'Doc

6467. Upping my drive from 4 to 8 watts

Newsgroup: rec.radio.cb
Date: 2000-09-24 00:00:00 UTC
From: HellTriX <HellTriX@Why.is.everyone.putting.no.email.addess.com>
Message-ID: <39CDC09D.77BE6D33@Why.is.everyone.putting.no.email.addess.com>
Source record: 52979

Hello all,

HellTriX here Ch. 36 (WA)
I have a President P220 (Regency Model P220) driving a Galaxy 250 liner with preamp. I think I have heard that this amp works from 2-8 watts best..

Well my current measurments are kinda low.
Radio output
4.5-5 watts dead key
22-25 Amp on low
50 +- on medium
75 +- on high

My radio does go a little dimmer when i have the amp on high while transmitting, and with the amp on my TX meter on the radio stays around 4db, but with the amp
off it goes into red around 6-9db if this means anything and also if you talk load it kinda dims that display alittle.

Is there a problem here?
How can I get my drive to like 6-8 watts so the amp will transmitt closer to the 200 range? I am running about 20+ feet of #10 wire from my battery with a 30 amp fuse that was originally used for my audio car amp that is where the radio is hooked to also.
One mor thing to add, When I dead key with amp on high, it is around the 70 watt mark, and when I start talking into the mic it will drop xmit power to like 50W or so. This is with the swr/power tester set on either avg., or pep.

Any input would be greatly appreciated.

Wow now he keeps a log book!Hey by the way did you ever make contact with
mir?
I did and have the qsl to prove it later
Dumbfuckie Chuckie

Also this was done with a circular polarized cushcraft 2 meter antenna and a yaesu
elevation rotor and logsat to track it and a yaesu ft 736 r.with the kansas city tracker rotor interface.I thought I wud give u this info cause I dont have any good radios.later dumbfuckie chukie

I panicked for a moment there because I thought that I might have also worked this self proclaimed racist. Fortunately I didn't appear in his log nor he in mine. I can't imagine posting a log book for this purpose in a newsgroup. This is what happens to some guy who has enough money to buy a radio and computer but doesn't have enough sense to behave like a gentleman.

k8cpa@arrl.net wrote:

Hi, this might be a dumb question but I looked through Radio Shack and could not find a replacement antenna for my Cobra handheld CB radio. I searched the web also without much success (most are long antenna for mobiles). I live in Houston, Texas, and would be interested in knowing if there is a place that carries CB accessories. If anyone has a spare one that fits Cobra handhled, I will be happy to buy from you too. Please e-mail me since I do not read this group regularly. Thanks in advance.

Well, the entry for 14.000 MHz for a phone contact is acceptable because many logging programs only list the primary frequency by band, BUT, I did note a contact at 14.233. Since he is a general, his band limit is 14.250, and yes by his own admission, he has been operating illegally.

Woops, I'll reply to my own post. His band limit is 14.225,. and that one contact was legal. My error. Still seems awfully odd that anyone would be posting logs like this.

Hello Charles: I am typing this slowly and using one and two syllable words for you.

Yes I know who posted what. It is clearly marked with the > and >> symbols.

Your answer to the question "NO" is wrong, in the sense that it's impossible to make a call like that from behind your computer.

I have seen to many TVI complaints, from being a TVI committee member in the local radio group. One thing I know for certain is when we look into a TVI complaint, there is a interference problem, and no one knows what the cause is until the equipment is looked at.

And I have heard way to many CB'ers, local and skip stations say how they eliminated or significantly reduce their TVI problems by replacing their A99 antenna with a beam or ground plane antenna.

Had a older gentleman CB type ah guy who lived in a trailer park, he interfered with everyone's everything. The station was barefoot and very well grounded. Replacing the A99 antenna with a MaCo V 5/8 cured all the interference.

And a other interference problem, we found a dirty and electrically intermittent volume pot. Not the A99 antenna.

Jay in the Great Mojave Desert.

I know it's a bit late to be replying to this, but I think you may
have lost sight of something. The radios your speaking of are not
'illegal' for hams to have, only CB'ers. Using them on non-ars
frequencies
~is~ illegal for hams. Different radio services, different rules...

Sounds like you need a larger power supply. The lights shouldn't
dim at all, that's usually a sign of 'loading down' the PS. I'd leave
the power output of your radio alone, you won't gain any significant
amount of output by going from 4 to 8 watts. Over driving the
amplifier
doesn't gain you any ~useful~ power, just a crappy signal.
'Doc
PS - #10 is too small for the distance and current draw. Think BIG!

next time your around 27 megacycles fire up the psk-31 on 27.700

your list isnt impressive at all chuckie. most of the contacts were other guys
in america. i did see a couple dx stations but whats so impressive about that?
i'm sure you were logged and got a quick 73. it sure wasnt a real qso.

>and most of these contacts were made on psk31 with less than 50 watts!

set that amp for a 30 watt dead key and then however high it will swing. you wont see any where close to 200 dead key out of this amp. they like a drive level of 1 or 2 watts

I just hope your SSB contacts on 14.000 were not SSB but CW!

The General phone band does not start until 14.225 Mhz. for transmitting SSB.
Now if you were listiening on 14.000 that maybe another case, but You should
have not been transmitting on 14.000 with SSB. So I hope your log is incorrect
about the actual transmit frequency. Then if that is wrong, what other mistakes
have you made?

james

Thanks for typing slowly.
The correct answer to the original question, is still no.
Antennas do not cause RFI.

Not hardly chief.. it's an error that happens when importing logs from
one logging program to another...

wrong again, I once imported my logs from Mlog to logger and it
basically got the frequency's on some entrys screwed up...

I made no mistakes, it's a error casued from importing logs from one
program to another...

Yep, I is back. Where have I been? Workin' and newsgroup pooter problems, and a quick trip to NY state. What have I seen & heard? Lots. What have I learned? Some. Has anything changed? Nothing, other than my neck is getting REDDER & redder. And I ain't out in da sun either, sunny!

I went to NY for a day recently. I encouraged all on audio (my mouth) AND on the CB to NOT vote for Hillary. Everyone was in agreement, BUT they are afraid that NYC (aka frozen apple man) and all his buddies may vote for her, putting her in office. I said that I didn't think that they were so stupid. They said NYC may put her in for a joke or something. Here is a joke for NY people: How do you know that you are in NY state? They demand payment BEFORE you pump your 4 wheeler gas! Or do they just do that on the Indian reservations? Actually it happened in Buffalo too. The anti-Hillary commercials on da potty band were great! I hope you NY people do the RIGHT thing and send Hillary and GORE away to their final resting places, even though there is NO rest for the wicked!!!!! Dave!!!!!!!!!!

Hello Charles: I'll disagree with ya here.

If a antenna like the A99 squirts to much energy below the horizon, and
it does, as compared to a ground plane antenna, then the A99 is designed
wrong in my book.

Just because the SWR can be adjusted to a low value, does not mean the
antenna is properly radiating.

Jay in the Mojave

I would suspect that you have not gotten the reception you expected on this newsgripe. Proselytes rarely do. Your log looks a lot like most 20 meter General logs. But 19 Kb messages are really stretching things.

Let me give you a slightly different outlook. First off, there is no inherent conflict between the services. CB frequencies are generally considered garbage freqs for serious radio but as it has developed these garbage freqs serve the purpose of getting a lot of people into a hobby fairly inexpensively and with a minimum of technical expertise required. Now before I get stoned:

1. Single-band capability is always easier than multi-band capability. Cheaper, too.

2. Things are people-sized at 27 Megs. A nine-foot quarter-wave is a hell of a lot easier to deal with than the 33 foot quarter-wave of 40 meters. At VHF, things get lossy and parts get really small. By and large, 27 megs is a good place to screw around.

You should also be reminded that people use CB for a myriad of purposes as they do on the ham bands. The codeless Tech is admirable for talkers and

local intercom use but of no giant value to the DXer. Two meters is admirable for getting the local glueheads to coffee but DX it ain't. Everyone is looking for the 'private channel'; VHF makes more sense for this use than CB and certainly 10 meters. Maybe we need a channelized service that requires a CDL to operate on. Not everyone is on 27 Megs to work DX. But the experience of multiple usages probably is also part of the education.

There are also some unique aspects of 11 meters that have to be somewhere. The infamous bowl comes to mind. I am not a great fan of beeps and bloops but when the average 2 meter repeater sounds like a calliope who are we to judge?

The code requirement for the ham bands is likely temporary but temporary is likely to be a few years. But as you can see, it is not the only barrier to getting legal. There has to be a bit of a commitment (perhaps even a situation in which commitment is an option :-)) to changing rigs, antenna structures, and friends. The social aspect is probably a stronger deterrent than the code.

I guess the major item is that a 19 Kb posting doesn't really tell anyone a whole lot they didn't already know.

Might I suggest a few projects for your amateur activity.
1. Get the Extra.
2. Fire up on the 40 meter Novice band. This seems to be the place to get your code speed up to a level that won't put the DX stations to sleep.
3. Listen on 160 this winter. Because you can't buy hardware at your local truck stop for this band, it is a friendly fraternity unto itself -- the Gentleman's Band. When you get up the cajones to fail miserably a few times, get a transmitter on it.
4. Twenty and 75 are the crown jewels of amateur radio. But try 15, for example. Whole different group of ops. Try the WARC bands for shits and giggles.

Unfortunately, Chuck, shooting fish in a barrel on the high end of 20 is not particularly impressive to either the CBer or experienced amateur.

Go ye and sin some more.

I know it's a bit late to be replying to this, but I think you may
have lost sight of something. The radios your speaking of are not
'illegal' for hams to have, only CB'ers. Using them on non-ars
frequencies
~is~ illegal for hams. Different radio services, different rules...
'Doc >>

These radios are sold as "10 meter ham radios". But they are not designed to appeal to hams. They are channelized and equipped with talk-back, roger beep, and turbo echo boards.

I have heard a handful of hams using them legitimately on 10 meter SSB (sans beeps or echo), but the rigs are generally shunned because of poor TX/RX calibration - among other things.

The FCC is eventually going to lower the hammer on the truckers using
10 meters illegally. May even fine the company they drive for.

I wholeheartedly concur.

The only thing more pathetic is that over 90%
of the so-called cb/radio shops in this country are
unable, for whatever reason, to make the necessary
adjustments to the lsb/usb tx/rcve offsets so that
would not be the case. Another contributing factor
is the inability to properly unlock and expand the
clarifier circuit. Many using "bad mods", or otherwise
unable to to this job properly wind up with a rather
distinct "split" between the transmitter and the receiver
frequencies. These stations are extremely simple to spot
on ssb. They and their "potential contacts" end up
chasing each other around the dial for a few minutes and
then move on. Sometimes I follow them and listen in,
just to see how long it takes them to "figure it out".

73,
NAO911/Jack

"Are you a sideband operator"? "Are you taking advantage of
the benefits gained from using receiver/audio level digital
signal processing"? "Can you see the advantage of being
able to eliminate another ssb station 1 kc above or below
your operating frequency"? Try DSP Today........

The problem is that you have a dislike for me.
You have already said as much.
I don't really care.
The fact remains that antennas do not cause RFI.
The original post was about someone that had a stereo, (I think) that was picking up interference from somewhere. After I answered the first question, someone else said that if the person operating the radio was running an Antron, then that was the problem, wasn't it.
Again the answer is no.
Lots of people, including myself, run an A-99, (which by the way does not say Antron anywhere on it that I could find) and have no problem with RFI. Therefore it is wrong to say that the antenna is the problem.
Most times the RFI is caused because the device that is being "interfered" with is actually performing a function that it was not designed for. If it was not designed to pick up radio transmissions on the frequency that it is doing so on, it is malfunctioning.

> Just because the SWR can be adjusted to a low value, does not mean the
> antenna is properly radiating.

SWR has nothing to do with RFI, nor proper radiation of an antenna.
I have said enough to you about this now. I will read your reply, but if you can't convince me that anything I have said is wrong, I'll not reply.

I am not disputing that it is happening, but what are the reasons for the truckers to use 10 meters instead of using 11 meters? Around where I am (eastern mass) there are always seem to be plenty of unused 11 meter channels available to chat without being bothered. I cant comment on what is happening on 10 meters around here cuz I just have a regular old 11 meter cb at the moment.

It is NOT illegal for an Amateur to modify amateur equipment... Out of band mods or otherwise, as long as he operates his equipment within the regs of the amateur service.

Hey Terry! Tell the whole story (if you know it). The 26 megahertz deal was abandoned long ago. You are a hammie and you don't see tons of enforcement? You obviously did not research this comment. Log on to www.rainreport.com and you will see an impressive number of actions taken by Hollingsworth and company each and every week, and yes, they are putting time into this recent endeavor. The frequency directional finding center in Laurel (Hill?) Maryland takes the credit for the majority of current action taken against hammies.

Another explanation can be broadcast remotes. There is a TV station not too far from me that I can hear clear as day on a certain frequency. Called the station and they confirmed that they do indeed transmit occasionally to their remote units for traffic, publicity appearances, etc.

You of all people should know not to make such an absolute statement. What perhaps you wanted to say was that an antenna may not be the cause of RFI. In fact, some RFI is the result of the antenna's near field radiation pattern, it's height above ground, and the location of the offended device in relation to the antenna. Note the absence of terms here like all, always, or every time.

Then there are better cb shops to be considered. Personally, I prefer to know exactly who is inside my radio and exactly what they are doing. I wouldn't deal with a shop that had to send my CB to someone else. There are exceptions to all rules, but if this shop has to frequently utilize outside techs for cb repair, I'd find another.

The '2879' will commonly run between 100 and 150 watts comfortably.
12 of them would give you something between 1000 and 1800 watts. You
~can~ get more than that, but not cleanly, and at the expense of part
life.
'Doc
PS - That's at a nominal '12 volts'.

Looks like I've been out voted.
I still can't see why the antenna, by itself, causes RFI.
Poor installation, of the whole system is another thing, but antennas
causing RFI? I just don't see it.
I've read a lot of books, AND installed a lot of antenna systems. I can
think of no book that I've read that states, "antennas cause RFI."
Neither have I ever had an RFI problem that could be traced back to just
the antenna.
Someone please point me to a book or something to help me out. I hate to
be one of the ignorant.

Michael J.Talkington,

Here are the manuf. specs:

Vcc = 12 Vdc.

Drive = 4w. am/fm, 15w.ssb (per device)

Output = 120w. cw, 180w. pep (per device)

With 12 devices, maximum drive would be:

48w. am/fm, 180w. ssb.

Do the math....

RFI can come from a number of sources, most of them indicative of a poorly designed or installed station. If you presume that your station is properly grounded, spectrally clean, operating within legal limits, then the only signal is coming from the antenna. The location, height above ground, and the radiation pattern of the antenna, etc, all relate to whether the guy next door is going to have his tv wiped out when you key down. Example: our local school district operates an FM station on the commercial band and produces a 60 KW signal heard over several counties. I can operate all sorts of electronic equipment within a couple hundred feet of the tower because the radiating antenna is at the top, 500 feet up, and the signal is going outward, not downward.

>>>Someone like you can't be heard on the bowl<<<

Hm. You won't like to hear this, but here it is anyway.

Except for local contacts, "who can be heard on the bowl" is entirely related to the effects of propagation - and not transmitter power.

If 11 meters is not "open", no amount of power will allow (for example) a station in Atlanta to be heard in Denver.

However, if the band is open and conditions are right, a guy with 20 watts can do it easily. And his signal strength will be nominally the same as guy using 1000 watts.

So all those stations that think their big power is the reason why they are being heard across the country are kidding themselves.

What many folks think sounds like "a powerful big radio" is essentially a "dirty" radio (one modified to generate spectral impurity and excessive modulation) amplified and splattering a wide chunk of band...whose signal is being temporarily propagated over long distances by multiple f2 layer hops.

Told ya you wouldn't like it....

Hell, I do my share of worldwide DXing and then some, and it's barefoot. But the bowl is fun, too.

OK.
I can do the same right under my antenna, (an A-99).
Now how does this prove that antennas cause RFI?

If you need an amp to talk to yugoslovia and england then you have radio problems. Been talking to both for long QSO's on 12 watts the last two weeks no probs.

Illya McCullum:
Are you related to Illya, from the Man from U. N.C. L. E. ? ! Not to be cornfused with Eeelian GONEzolas!

Good blast against this proud Hambo, but what he really is IGNORANT of the CB band, which NO OTHER BAND has done what CB has:

1. Main reason WHY I like CB is because I get to MASH MY MOTOR and hide from the "bears" because I can't go what the insurance companies want me to travel @ ! I obey the Constitutional "speed" limit of infinity!!!!!
2. CB is for people using THE ROADS, mainly the interstates, to warn OTHERS of DANGER AHEAD (slow downs, accidents, jam ups, and so on). Not even an 870 mc communist cell phone can do that! And the propagandists say that cell phones took the place of CB? Never will! CB keepes YOU awake and prevents big time accidents & DEATH. Are you pro-death? You ARE IF you are anti-CB !!!!!!
3. It truly must be a VERY SMALL MIND that degrades CB to try to puff up some other band! You (punk) are surely a small peon that isn't worthy to key up on 27.185 heterodyne, sunny! Throw away your hambo radios and get a life AND a CB ! Then you will learn what it is to be a CITIZEN, band!
4. And 4thly and not lastly, GET OFF of my CB newsgroup! I won't listen to your QRM on the hambo freqs. or on the pooter newsgroup! If you must cut down CB because you are pro-death, then do it on your hambo newsgroup or freqs., freak! Also get a haircut, get your earrings removed, and if you be a man, you'll put a 108" whip on your wife's car!!!!
Dave!!!!!!!!!

I would suspect that you have not gotten the reception you expected on this newsgripe. Proselytes rarely do. Your log looks a lot like most 20 meter General logs. But 19 Kb messages are really stretching things.

Let me give you a slightly different outlook. First off, there is no inherent conflict between the services. CB frequencies are generally considered garbage freqs for serious radio but as it has developed these garbage freqs serve the purpose of getting a lot of people into a hobby fairly inexpensively and with a minimum of technical expertise required. Now before I get stoned:

1. Single-band capability is always easier than multi-band capability. Cheaper, too.

2. Things are people-sized at 27 Megs. A nine-foot quarter-wave is a hell of a lot easier to deal with than the 33 foot quarter-wave of 40 meters. At VHF, things get lossy and parts get really small. By and large, 27 megs is a good place to screw around.

You should also be reminded that people use CB for a myriad of purposes as they do on the ham bands. The codeless Tech is admirable for talkers and local intercom use but of no giant value to the DXer. Two meters is admirable for getting the local glueheads to coffee but DX it ain't. Everyone is looking for the 'private channel'; VHF makes more sense for this use than CB and certainly 10 meters. Maybe we need a channelized service that requires a CDL to operate on. Not everyone is on 27 Megs to work DX. But the experience of multiple usages probably is also part of the education.

There are also some unique aspects of 11 meters that have to be somewhere. The infamous bowl comes to mind. I am not a great fan of beeps and bloops but when the average 2 meter repeater sounds like a calliope who are we to judge?

The code requirement for the ham bands is likely temporary but temporary is likely to be a few years. But as you can see, it is not the only barrier to getting legal. There has to be a bit of a commitment (perhaps even a situation in which commitment is an option :-)) to changing rigs, antenna structures, and friends. The social aspect is probably a stronger deterrent than the code.

I guess the major item is that a 19 Kb posting doesn't really tell anyone a whole lot they didn't already know.

Might I suggest a few projects for your amateur activity.
1. Get the Extra.
2. Fire up on the 40 meter Novice band. This seems to be the place to get your code speed up to a level that won't put the DX stations to sleep.
3. Listen on 160 this winter. Because you can't buy hardware at your local truck stop for this band, it is a friendly fraternity unto itself -- the Gentleman's Band. When you get up the cajones to fail miserably a few times, get a transmitter on it.
4. Twenty and 75 are the crown jewels of amateur radio. But try 15, for example. Whole different group of ops. Try the WARC bands for shits and giggles.

Unfortunately, Chuck, shooting fish in a barrel on the high end of 20 is not particularly impressive to either the CBer or experienced amateur.

Go ye and sin some more.

Actually, if I had a customer with a Twisted Head, I would send him to the competition. My Job as a CB super Field Tech is to UN-screw twisted heads that are cornfused of what the IDIOT BUTCHER modulation kit installing alleged CB shops are doing to people's radios! And to point them away from RED Chinese made CB's, like Cobras & RAT Shacks! Not to mention the idiots that put in "talk back" when there is NO echo board in the CB !!!!!!! NO THINK CB shops do that!!!!!!!!!!!!!!!
Dave!!!!!!!!

twistedhed@webtv.net wrote in message
<6260-39CE621D-58@storefull-122.iap.bryant.webtv.net>...
Then there are better cb shops to be considered. Personally, I prefer to know exactly who is inside my radio and exactly what they are doing. I wouldn't deal with a shop that had to send my CB to someone else. There are exceptions to all rules, but if this shop has to frequently utilize outside techs for cb repair, I'd find another.

I know what we're talking about. RF, and RFI are not exactly the same
thing. While the antenna may transmit RF, it does not CAUSE RFI.

Ok. Let me put it into perspective. You are somewhat preaching to the choir, here, as I am aware of tropospheric ducting, ionospere and atmospheric conditions, in other words, I understand propagation just fine. What I am saying, is if he is in, lets say DC, and the skip is running my way on the bowl from DC, he's getting squashed by a big maul that happens to be in the DC area! In this scenario, watts matter.....and he's qucked.

Damn netscape, didn't finish composing my msg before it sent.

To finish my thought. It was two different broadcasts I would hear. One sounded like a British broadcast. Other times I'd hear what sounded like Japanese or Chinese.

I wasn't using a preamp at all. It would come straight off the Spectrum 1600's coax with nothing in line.

:)

As a ham for over 20 years, I partially agree with you.

There are however, some other factors to consider.

MARS is not the only service what requires modification of equipment.

I was heavily involved in Civil Air Patrol Communications for 15 years, and served as the State Director of Communications for our state for 5 1/2 years. CAP also operates on HF and VHF Frequencies belonging to the Air Force.

On VHF, we used frequencies on 143, 148, and 149 mHz.

On HF, we operated on 2,4.5,7,9,11,14.9 22, and 26.620.

CAP units were authorized a power lever well above the 4 watts legal for CB on the 26.620 mHz.(As long as it was obtained with a self contained HF unit, and not an external amplifier)

CAP also participated in a multi-jurisdictional HF interoperability service known as "SHARES" made up of numerous other Federal agencies and hams. Many times CAP stations were authorized operation on these other governmental frequencies during operational tests and drills., as well as actual emergencies.

Most of my legally modified equipment was modified by the dealer from which it was purchased) for CAP purposes.

Did I go back and "Unmodify" the stuff when I got out of CAP? No!

None of the hams I know who own modified gear use it illegally. I think if as many hams violated the rules and regs as you suggest, there would be tons more FCC Citations, and Riley Holllingsworth of the FCC would be putting in some very long hours.

To many hams, I think it was a case of just desiring to have the capabilities which lead them to do the mods, or simply the "IN" thing to do to prove their technicial abilities.

Don't get me wrong, I am sure there are probably abuses by some hams, as we know there are abuses of ham frequencies by unlicensed operations, but I just do not think it is as large a problem as you think it may be.

Hello again,
I just posted to another of your posts I think.

Another reason I read this group is I am interested in RADIO, not just ham radio.
I also assist a local CB shop in some of the more technicial repairs, of rigs where the troubleshooting required is a bit beyond their abilities and knwledge. In fact one commercial two way shop in our area started out as a CB shop, and the area's nicest and best stocked CB shop is owned nd operated by a ham, with at least one additional ham employee that I know of.

A few years ago, Wayne Greene of "73 Magazine" wrote concerning hams ignoring thje CB repair and installation business as a source of employment.

I ran one of these back in the 70's! It was a great clean amp that never
bothered the neighbors. If I remember right this was an amp that was
designed for business band. This would make a nice collectors piece for
someone. The last time I ever came across one was in the 80's! Good
luck on your sale.....

=======

Not bad for a dumb ham operator... Huh?

and most of these contacts were made on psk31 with less than 50 watts!
how's that for impressive?

try that on CB!

73

-Chuck K8CPA

Talk around the world....LEGALLY!

Advanced Specialties 1-800-926-9426 or 201-843-2067

I would like to know if the radio has small enough tuning steps to be an effective SSB rig without having the clarifier modded for transmit. It would be nice to get a set that could talk to more than one person on a frequency and still be on their frequency; both transmit or receive... From what I have been able to gather the steps are 1,10 and 100 kHz and the specs I have seen refer to the tuning as VFO rather than channelized.

Also, export radios sells the "turbo tuned" version which is supposed to do 65 watts peak AM and SSB . They give it a 1 year warranty while the stock unit has a 90 day warranty. I can't tell any difference in the radios from the description other than possibly opening it up and moving a jumper and clipping a diode, but don't know that for a fact. That option is $69.00 more. They don't mention updating the finals or any hardware additions. The stock output is compared at 8 RMS on AM and 22 on SSB

Bills has as good a price as anyone I have seen with it(doesn't include shipping). Advanced offers a very reasonable price including shipping. Neither revealed much tech info on it or had knowledge of a schematic for it telling the exact board it used (there is probably good reasoning in this stance, and my mentioning it is not meant to deter from the rig or the dealer, just general info from the inquiries I have made on the rig).. Rumored to be the same as the Magnum 257.

Firmware features from the manual scan available from Bills are similar to the CPU Masked LC7232 in the Cherokee CBS-1000, Albrecht 497 and others, but this is just a hunch; no confirmation.

Coverage looks to be from the middle of the 12m band to the upper edge of the 10m band.

Packet output on rear panel offers some interesting possibilities.

If anyone has actually seen one perform, I would like to hear what they thought of it and any negative features observed. I am looking to buy one in the next 10 days, if I can confirm it will be a good SSB performer and frequency agile enough to allow the clarifier to operate as a RIT control and not affect transmit frequency.

If anyone has a link to an evaluation, review or performance report, please list it on the NG.

David

Hey CD...the band was crowded tonight! I'll catch you on the "old freq"
tomorrow. The one on 80 meters.

Gee Mr. H,
Unfortunately, CD doesn't want the CB world to know that he is also a ham. He is guilty of the same rhetoric on 40 meters that he spews on this NG. Tisk...tisk....

That is the first I have heard. If it is, at least some service info is
available.

Your right, I haven't. But I have dealt with a Nisson p/u
with a 35 am alternator. Running radio (20A), amplifier (40A),
and a second battery. Headlights dimmed at night, engine lost
RPM, and sitting still with the engine off, the left turn signal
and oil light came on... Got rid of the amplifier... Then the
pickup. (Miss the p/u, not the amp.)
'Doc

6585. Midland 77-099

Newsgroup: rec.radio.cb

Not only that did you abserve the different TO-142 pin layout *and or note*
inside that "little green box" ?
.............hope it didn't mess up the analog switch blowing the PLL,
tunnel diode or synth related parts.
Never use a ECG or NTE get a OEM from Bills or Mouser

Your Mic amp (or half of it if a dual op amp) is good for FM to function.

Look for a bad AM regulator if you have dead key on AM and no modulation.

Here is a good site for export chassis schematics.

http://members.nbci.com/annemor/sch-cb/index.htm

That first 8950 should only need about 15 watts PEP for full power output.

Either amp bad, tube tester bad, something wired wrong (that is a 110 amp only) or someone wired all 4 tubes as finals.

In that case, hit it with 60, and you should see about 750 to a grand PEP.

However, you should see about 450 to 500 watts with 15 to 25 watts of drive in stock configuration (PEP)

> well i have yet to test it for myself , but i always heard that a leece
> neville will only put out a certain amount of maximum volts,

Your right, when the shaft (rotor) is at its designed rotational speed,
you will get max current.

A. Keep the alternator cool (run external diode packs). This allows for mo
amps
B. Use the alternator sparingly (shut down the power supplies in between
keys.. Keeps shyt kewler)
C. When using a smaller pully, you can get more current out of the
alternator than
when using the stock pulley..

I put C in here, because you asked what my idle voltage from alternators
is.. To be honest,
I would have to go outside, fire the burban up and check.. Been a while.

But, mine is still slightly more than normal, since I use a smaller pully on
the rotors.

so i don't
> understand how smaller pulleys will change the equation.

See above.

are you
> running 500 volts on the screen as recommended in the eimac book?

Eh?

On the spec sheet, it states up to 1600V DC on the screen.

I run slightly more than 1250 (bounces between 1200 and 1300, honestly)..
Not the best for linearity, but what do you expect from a cheezy inverter.

on
> the grid voltage, what is the determining factor on the size of the
> negative bias? is it the amount you want to drive it with coupled with
> classification?

I don't follow you, so my interpretation below might be a bit off.... :(

You set the grid bias to give you the operating point (and when running a
tetrode as a tetrode, screen voltage plays a part, as well) you want to run
in.

Set screen voltage to give you the wanted (designed for) ZSAC (that means
Zero Signal Anode Current, or IOW, key the amp with no drive, and all other

voltages going)

i am still chewing on this and reading on it, and it
> will be only a matter of time before i figure it out. perhaps
> theoretically it can be determined by formulae.

There are fairly good modeling programs out in shareware.

Go to QRZ.com and check them out.

i think the use of
> contactors is a good idea, but i think i will run twin systems thereby
> negating the need for them ,

I couldn't fit all those alternators under the hood.. I plan on 2 to 32
pill
and the ACs.. Too many alternators to haul around, especially since I
haven't keyed in a keydown in 10 years. This is all for fun for me..

The thrill of building, not operating anymore... :-\

i got the room and the juice. still
> chewing on how to turn this bug a boo on and off and make sure it is
> off

What do you mean? When the alternators stop spinning, the amp is off :)

If you really want a bulletproof amp in the mobile, stick with either a 3CX
tube
or a 4CX strapped over as a 3CX. Those 4CX strapovers will allow more
drive,
increasing feedthrough power in most cases.

Or, if you mean, in between keys, you want to shut the amp down, thats
easy...
Just stuff 5 to 600 volts on the grid (if you running screen volts, that
is).

My box that is the Class C version runs different. The power supplies are
all brought down
on that boxwhenever it isn't keyed. The only thing that stays running is
the filament transformer.

>and other saftey considerations such as possible ground fault
> problems. as you know, it will take just one time and that is the end
> of life as i know it,.......cd is out.......
>

You got that right, it takes time.

A Leece 165 amp 14 volt alternator will do 60 to 80 volts stock, run full field.

That is with little to no current draw (like 7 amps, just enough to turn on the field)

I typically see about 17 to 20 volts from a Leece, when cold, at 200 amps from
the 165ers.

It will eventually drop to about 165 to 175 when the alternator / diode pack get
to operating temperature.

Use a simple 1N4003 diode trio, and sample the voltage, then regulate the alternator to
give you whatever you want out of it.

And your figures are correct for a Leece Neville operating under load, at operating
temperature.

www.rfparts.com

You will find the Uniden Export Service Manual on that page.

Get it

Good

You now have a schematic.

Train took care of it.

Sorry to have missed ya Chris, but I was busy the latter part of the week, and I forgot your addy on the computer desk when I left (was late to the airport).

Next time... Next time... :)

> Who cares what you think?
>
> Those so-called amps are harmonic generating pieces of junk.

The class C shitboxes, Yes.

The Messengers, Blue Face amps, and the Magnums of yesteryear would
put any Henry SS amp to shame. So do the Texas Stars.

>
> Get a real amp, like a Alpha,

Tube, base amp

>Henry

Tube, base amp.

>or Drake,

Tube, base amp

then come talk to me
> about power!

And when you get a tube that has handles on it, come talk to me.

Get off that glass shit, and step up to the steel!

>
> Same goes for Texas "stepped on" Star
>
> A friend of mine has thier "Sweet 16" in this car.... I could step on
> him with something with a pair of 3-500Z's in it all day long!

So, lets see...

We are talking about 8 transistors that are rated at 100 PEP watts

Against you two tuber, rated at 2Kw PEP input or better.

The Texas Star is in a mobile

Your 2 tuber is on a base.

No wonder why you could key on him!

I keep
> asking him to let me bring over my buddies BIRD watts meter and see
> what the amp REALLY does...

On the Bird, with the recommended driver (a Mod series amp), it will show
about 4 to 500 Bird.

>he keeps avoiding me... Gee, I wonder why?
>
>

That comment would be good pointing it to any sane individual.

>
> (might be becuase his so called 1600 watt amp does about 800 watts on
> a GOOD DAY!)

No, because his 1600 watt amp is rated to do 1400 watts PEP, and you are
going to compare ratings wrong (model #s Vs. suspected output) and use a
meter that won't even come close to measuring what you want.

Even with your arrl.net email, your still a moron Chucky.

> 11 meter linear amps.
> well just a word of thought

What caught my eye was when he used his amateur radio 2X3-500Z box to
ILLEGALLY test it against the Sweet Sixteen.

Either the Sweet Sixteen was being operated on the amateur bands (which it
will do)
and they where purposefully causing interference to each other, or Chucky
was
kickin it ILLEGALLY on the 11 meter band using too much power.

Get legal

Get a life.

RF causes RFI. RFI occurs when the offended item receives the RF in such a manner that it can't properly deal with. Each antenna has a different angle of radiation. If the item incapable of dealing with RFI is not getting hit, then it won't react becasue it sees nothing to react to. In other words, if the RF is being shot over, above, or in another direction, then there is no problem with that one item. If it is getting a full direct dose, then it reacts to the RF, hence, RFI.

6609. CB Gear for Sale

Newsgroup: rec.radio.cb
Date: 2000-09-25 00:00:00 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8qnf0e$o9n$1@nntp9.atl.mindspring.net>
Source record: 53129

Time to make some room for more new toys and old gear.....

BASE RADIOS:

1..... Browning R27/S23 with Banana Mic and stand $200.00 plus shipping
In working condition, but receive fades after warm up. Sounds good on transmit and receive is sensitive until fading occurs. I think it needs a nuvistor in the front end, but not sure. Transmitter meter has been replaced with non-standard meter. I bought a replacement meter for it, but received a receiver meter instead.Dial would have to be changed to use it. Some documentation included

2..... Browning MKIII AM/SSB Receiver and AM transmitter with G-Stand D104 $250.00 Plus shipping
In working condition, sounds good on transmit and receive, Some crystals out of tolerance on Transmitter. Some documentation included

3..... Browning MKIII AM/SSB Receiver and AM/SSB Transmitter w/bananna Mic $250.00 plus shipping
Rig is barely working, but repairable. Have extra AM/SSB RX and AM/SSB TX chassis for parts units to go with this pair. Banana mic is complete with original cord and plug (incorrect setscrews on plug), no stand and mic not working (possible bad element). Some documentation included

4..... Two Cherokee CBS-1000 one box and one Cherokee stock hand mic $150.00 plus shipping for pair
inop/repairable - I have seen both of these rigs talk at various times. Each time further repair was attempted, much further repair was needed. They have lost their charm..... .PDF File included with service information

5..... Cherokee CBS-500 w/Cherokee Hand Mic $125.00 plus shipping
110 VAC or 12 VDC. Has old, non epoxy-shrouded firmware with exposed and functional option jumper header strip. Variable power has been added and modulation limiter circuit not modified. Internal adjustment for dead key of 0 to 4 watts, now set at 2 watts. Very respectable audio quality with hand Mic and a real performer with a power mic. Has 4 memory presets, Dual Watch, NB, ANL, Auto Scan, Memory Scan, Instant channel 9/19, RF Gain, Headphone Jack, External Speaker Jack, 12VDC power jack and Front facing speaker for limited space installations. This is a very nice compact base with interesting performance.. .PDF file of service info included, also documentation of vari-power addition.

6..... Cherokee CBS-500 w/Aires (Sadelta) Power Hand Mic with Echo $140.00 plus shipping
See description above..... Has same treatment on Variable power circuit addition and exposed option jumper header strip and accessible firmware on

display board. This unit has a 20 turn pot mounted in one of the case screw holes (left front) for variable talkback that allows precise setting without feedback for any operating combination. I can provide the option of switchable vari-power if buyer desires, as rig has 2 mounting positions for mini-toggle switches on right front side of cabinet that are not occupied. Very solid performer, and with the old Display board treatment no longer available in newer models. .PDF file of service info included also documentation of vari-power addition

7..... Johnson 250 50th Anniversary / mic $50.00 plus shipping
In working condition with stock hand mic.

8..... Lafayette Comstat 25B $45.00 Plus shipping
Working but not collector quality. Good for parts unit to restore another rig

9.....President Dwight-T (No Outer Case or bottom cover) $35.00 plus shipping
Good talker, uPD858 PLL, Clock and meters working. Note case or bottom cover. Sheetmetal around fuse holder distorted where previous service attempted to replace fuse holder. It has since been replaced and the chassis straightened as much as possible. Would be a good project for a nice wooden case.

10.... Robyn T-123B $50.00 plus shipping
Working, no apparent mods. Good for adding to the collection, but has signs of wear on front and paint chips on cabinet where bracket was mounted. Do not have tilt mount base stand that was an original accessory for this radio. A nice one, but not a great one.

11.... Two (2) Tram D201 $200.00 plus shipping for the pair
One complete (minus relay) and I have had it working to some degree in the past but would consider it to be inop for the purpose of this description. Second rig missing receive VFO and SSB indicator lamp, Audio and final tubes. Were purchased represented as complete and repairable... I will list them as almost enough to make one good working unit. Complete unit has Silver ID Tag with Yellow Diamond containing the "T" of Tram. Other unit has Black ID Plate with Tram in Silver and D201 in orange. I think at least one of them is referred as the "Ratsnest" version of the 201. Use for parts, repair or restore......

MOBILE RADIOS:

12..... Three Cobra 29 $45.00 plus shipping for all
One complete, one minus channel selector and covers, one missing covers. Usable for parts or repair.

13..... Two (2) Palomar Digicom 100 $150.00 plus shipping for pair
These are Mobile rigs with dual channel selector switches made for Palomar by CPI. Have service info with interesting possibilities. Rigs considered to be usable for parts or repair. No mics included,,,,

14..... Two (2) Midland 13-857 w/ stock hand mics $40.00 plus shipping for pair
Were working when packed away. Crystal rigs, not the later "B" model with PLL02A. Usable for parts or repair; may still work, but 23 channel and not to be sold for on-air use.

15.... Uniden HR-2600 w/2510 firmware and stock hand mic $175.00 plus shipping
2600 firmware has been removed and board socketed, Has 2510 firmware installed and could accept Chipswitch if buyer wants to upgraded it at a later date. Modulation improvement addition made and Variable power (using SWR Calibrate knob) had been added. These changes can be reversed prior to shipping if buyer desires. With original mic (up/down buttons) and manual copy.

MICROPHONES and ACCESSORIES:

Demco Modulator $50.00 plus shipping
Working.... 4 pin and 5 pin mic jacks have been added to front panel, along with a 3 position/center off toggle switch to allow selecting original, large 4 pin mic jack or either of the 2 newer style mic jacks. Add some Audio to your vintage tube rig.

AMPLIFIER PARTS:

Mako 300 tubes good - needs tuned input circuit $200.00 plus shipping
This one was taken in trade after suddenly going dead. Found past owner had replaced relay on Keyer/Preamp board with a relay external to the PCB and wires at relay weren't insulated. Also, tuned input circuit had been hacked and melted coil-form at rear-panel input match adjustment. Has good tubes, was doing claimed 450 watt output. Relay wires have been reworked and insulated, relay has been secured to chassis. Will provide inefficient amplification when input applied directly to drivers, so my guess is a tuned input circuit will get it back going. I am selling it for the value of the transformer, tube, cabinet and RF part content; not for use on the air. Use for home-brew conversion to Ham or repair parts.

Palomar 300A - no tubes, parts robbed - w/power supply $100.00 plus shipping
Power connector (Jones plug) on amp rear missing. Plate choke missing, one Cap in power board of amp missing. Power supply complete and assumed working. All controls, switches, meter, cabinet look in good shape. 10, 15, 20, 40 meter band select. Black base with Chrome top. No Tubes. Use for repair parts or home-brew project. Selling for part content and power supply value.

Speculation in NewsGroup is great, but would prefer serious offers via email.

i tell you what x. when i sit here and listen to 20 stations all out of new york city, half the time i cant hear anybody because there all running kneck and kneck. but when the big man over there keys down he wipes my radio clean and no heterodynes or weaker signals are heard, you cant tell me it isnt about watts. surely propagation has something to do with it but these guys on the bowl are competing with there fellow locals and its the watts that do matter. i will agree with you though that say a station here in texas and a station in arkansas or somewhere cant really compete fairly because of conditions but when there are 50 guys in houston trying to talk and only a couple being heard daily the watts and antenna are going to make the difference every time. theres a reason there are only a small amount of big guns that are heard on the bowl consistantly. sure somebody can get there numbers called once in a while if the dx is right but to do it day in and day out on 27.025 you have to have the numbers on the bird. your example about the 1 s-unit a amp may add to the signal doesnt hold water. evidently you really dont know how big the amps some of these guys are using. there putting alot more then 6 db extra inline wih those big ceramics they use

>
><< Ok. Let me put it into perspective. You are somewhat preaching to the

6611. Re: More voltage for my mobile liner?

Newsgroup: rec.radio.cb
Date: 2000-09-25 00:00:00 UTC
From: sideband <sideband@cac.net>
Message-ID: <7vmuss8ffam5rbk3rq35oba6cuinf2d5eu@4ax.com>
Source record: 53131

If you're getting voltage drop like that, you need to put bigger wire in, before you think about volting the amp. I would say 10 guage at an absolute minimum 6 or larger would be better, but don't go overboard. 0 guage or welding wire would be too much.

Also, a 35 amp alternator? Try to find a larger unit. that alternator just won't keep up with the amp and the motor running at the same time.

You'll get more out of the amp with less voltage drop.

If you want more after that, THEN you'll have to think about multiple alternators, regulators, custom braces and mounts, extra batteries, and alot of work.. and a 250HD, in my opinion, just isn't worth THAT much effort.

Get the voltage drop problem taken care of, then see how you feel about volting the amp.

Just my two cents.

I run a +2 on my 2000 at home, too... "at home" being the key words here. The Delta Force is a mobile radio, and in a mobile, reducing background noise, which, especially in a truck, can be VERY loud, aids immensely in transmitting a readable clean signal.

I always have, and always will, advocate a noise cancelling mic in a mobile.

Power mic's for the base station are great. Personal choice there.

Again, just my two cents.

also don't forget about the antenna , if you want to get out farther make sure you have a nice big antenna with the lowest swr's you can .

it doesn't matter how big your amp is , if you have a crappy antenna you are not doing anything .

and i agree with every one else , got the junk yard , get a bigger alternator , and get bigger wire to that amp . " volting-up " isn't worth it if your just a talker , its not worth the damage it can do to the amp .unless you plan to goto some keydowns , leave the volys alone

I hear ya' Tim! When I scan the dial, I hear more DX on the high end of 26 than above 40(Am..not ssb) Also have a scanner (with super-duper Kryptonite, hyper-extended, cosmic signal grabbing antenna that touches the milky way) going 24 7 and I can count on one hand the number of times I heard ANY activity there besides DX in years. And, I know, Jerry, I know, just because I can't hear them doesn't mean they aren't there. Guess what? If my antenna can't hear it, they aren't there. DX isn't just one way. Not that I care that much anyways 'cause I have enough fun on the bowl and sideband.

REPORTS OF COMMITTEES ON PUBLIC BILLS AND RESOLUTIONS

Under clause 2 of rule XIII, reports of committees were delivered to the Clerk for printing and reference to the proper calendar, as follows:

Mr. BLILEY: Committee on Commerce. H.R. 2346. A bill to authorize the enforcement by State and local governments of certain Federal Communications Commission regulations regarding use of citizens band radio equipment (Rept. 106-883). Referred to the Committee of the Whole House on the State of the Union.

CONGRESS: 9/22/2000 12:27pm: Placed on the Union Calendar, Calendar No. 533.

Okay all you CB'ers, this is major movement in Congress on CB Radio Regulations by the FCC. Y'all might want to either pitch your bitch to Congress and start chucking your illegal linear amp wall bangers!

To authorize the enforcement by State and local governments of certain Federal Communications Commission regulations regarding use of citizens band radio equipment. (Introduced in the House)

HR 2346 IH
106th CONGRESS
1st Session

H. R. 2346
To authorize the enforcement by State and local governments of certain Federal Communications Commission regulations regarding use of citizens band radio equipment.

IN THE HOUSE OF REPRESENTATIVES
June 24, 1999
Mr. EHLERS (for himself, Mr. COBLE, Mr. DINGELL, Mr. UPTON, Mr. HOBSON, Mr. HOEKSTRA, Mr. TRAFICANT, and Mr. CAMPBELL) introduced the following bill; which was referred to the Committee on Commerce

A BILL
To authorize the enforcement by State and local governments of certain Federal Communications Commission regulations regarding use of citizens band radio equipment.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. ENFORCEMENT OF REGULATIONS REGARDING CITIZENS BAND RADIO EQUIPMENT.

Section 302 of the Communications Act of 1934 (47 U.S.C. 302a) is amended by adding at the end the following:

`(f)(1) Except as provided in paragraph (2), a State or local government may enact a statute or ordinance that prohibits a violation of the following regulations of the Commission under this section:

`(A) A regulation that prohibits a use of citizens band radio equipment not authorized by the Commission.

`(B) A regulation that prohibits the unauthorized operation of citizens band radio equipment on a frequency between 24 MHz and 35 MHz.

`(2) A station that is licensed by the Commission pursuant to section 301 in any radio service for the operation at issue shall not be subject to action

by a State or local government under this subsection. A State or local government statute or ordinance enacted for purposes of this subsection shall identify the exemption available under this paragraph.

`(3) The Commission shall provide technical guidance to State and local governments regarding the detection and determination of violations of the regulations specified in paragraph (1).

`(4)(A) In addition to any other remedy authorized by law, a person affected by the decision of a State or local government enforcing a statute or ordinance under paragraph (1) may submit to the Commission an appeal of the decision on the grounds that the State or local government, as the case may be, enacted a statute or ordinance outside the authority provided in this subsection.

`(B) A person shall submit an appeal on a decision of a State or local government to the Commission under this paragraph, if at all, not later than 30 days after the date on which the decision by the State or local government becomes final, but prior to seeking judicial review of such decision.

`(C) The Commission shall make a determination on an appeal submitted under subparagraph (B) not later than 180 days after its submittal.

`(D) If the Commission determines under subparagraph (C) that a State or local government has acted outside its authority in enforcing a statute or ordinance, the Commission shall preempt the decision enforcing the statute or ordinance.

`(5) The enforcement of statute or ordinance that prohibits a violation of a regulation by a State or local government under paragraph (1) in a particular case shall not preclude the Commission from enforcing the regulation in that case concurrently.

`(6) Nothing in this subsection shall be construed to diminish or otherwise affect the jurisdiction of the Commission under this section over devices capable of interfering with radio communications.

`(7) The enforcement of a statute or ordinance by a State or local government under paragraph (1) with regard to citizens band radio equipment on board a `commercial motor vehicle,' as defined in section 31101 of title 49, United States Code, shall require probable cause to find that the commercial motor vehicle or the individual operating the vehicle is in violation of the regulations described in paragraph (1). Probable cause shall be defined in accordance with the technical guidance provided by the Commission under paragraph (3).'.

6636. FS or Trade: Lambda EMI TCR 20S50 Power Supply

Newsgroup: rec.radio.cb
Date: 2000-09-25 00:00:00 UTC
From: mystique224@home.com
Message-ID: <39CFE4BA.EBC39169@home.com>
Source record: 53156

This is a industrial quality 0-20V 0-50A power supply. It is in almost mint condition with less than 15 hrs. of use on it. These sale for $1500 new from Lambda. Tucker electronics offer them reconditioned for a $1000. The only flaw on this unit is a scratch on the top cover. Other than that, you cannot tell it has been used. I will guarantee the unit 100% functional or your money back (that is of course, that the buyer agrees to pay for insurance during shipping). This unit is pretty heavy and I would expect around 75-80 lbs. of shipping weight. I might be willing to trade for a good HF rig. I have included a link to Lambda's homepage which includes the specs for this unit. This unit looks exactly as the ones at this link, except it is only about 4" tall. I am asking $800 for the unit and I will split S&H costs (not insurance). Again, if you are looking for a power supply that means business, look no further. And you are getting it at almost half the price at which I bought it. All serious inquirers please email direct.
Thanks,
J.R.

Is it USB and LSB? If not maybe the Local Oscillator circuit for one or the other is bad, causing spurs and mixing in the broadcast band. We need more information, i.e.. are you receiving anyone on channel along with the broadcasts? USB, LSB or both? Is it local AM BC band or SW BC Band? If it was a preamp, or front end problem as others have suggested, why aren't you getting the BC on AM mode?
Ron

Disagreed......CB radios are hardly what I'd consider "long distance". They have
their uses....and serve them quite well.

I have one myself....in a little Dodge Neon to boot...

Only that topic, the rest pertains to CB in general (public use and non-commercial). The UCC already has it's own regulations for all things involved with Commercial Carriers. Keep in mind when the Clinton Crime Bill passed early in his first term there was a lot of money dedicated to Law Enforcement (on the surface). Soon after that, law enforcement agencies began to get "accredited" in order to qualify for these funds. Part of the requirements was to drop state sovereignty and cross deputize federal agencies for jurisdiction in the local area. Now there are no jurisdictional boundaries. Just as DNR (Department of Natural Resources) is now writing speeding tickets and using the local city and county frequencies with a local unit number assigned, other agencies are now enabled to enforce or regulate areas never intended by their charter and implementing legislation that created them.

Since the FCC was sharply downsized in the last decade, the ability to impose much higher fines was awarded to them as a means to create revenue. Now, despite that, they have gone back to the feeding trough to get state and local enforcement of what their department was created for. Never mind that the FCC was only chartered to regulate intra-state communications (Federal enforcement operations are only allowed at the invitation or permission of the State in a Representative Republic, which is the form of Governance specified by our Founding Fathers). Inter-State matters are and always have been the responsibility of the representatives of law enforcement approved by the citizens via local election, as the individual citizen is the sole source of power in a Representative Republic such as ours. We give power to our representatives; local, regional and federal. Power is an inverted pyramid; with the largest portion belonging to the citizen (as birthrights), and progressively less power at each step of the representative trail, where the peak of the pyramid (Federal) has the least amount of power. In a matter of years, all remaining forms of Sovergnity and State's Rights will be a fading memory, and this is just one of many new forms of enforcement currently ongoing with more being penned each day by a governing body that is clearly out of control. Remember, we are a Representative Republic; not a Democracy. We have never been a Democracy (Mobocracy). In a Democracy, 51% of the public could vote to eat the remaining 49%, and it hasn't come to that .... yet ...

We give up a large percentage of our paychecks to support a governing body that devotes 99% or it's resources trying to make criminals of 100% of the population.

Greetings Comrade

David

Anyone who has ever witnessed local law enforcement using a sound pressure meter to enforce "sound ordinances" can appreciate the skill level in technical matters exhibited by the rank and file LEO (Law Enforcement Officer). We also had a good example when window tint was first limited to a certain level. We can only hope that the power, if awarded, can be understood and not abused. I would hate to have a door kicked in by a "cowboy", with gun drawn, that is thrilled beyond description to be the new "Frequency Police" in town, especially if the interference emanated from my neighbor's "industrial strength" bug zapper. With the extensive training that local law enforcement will receive prior to making spectrum the new revenue profit center, the officer would not know the difference between a linear and a UPS; both have wires coming out of them.....

A little humor is always appreciated. Keep in mind that the folks bringing this new measure don't know the difference between Channel 19 and 80 meters. Just imagine what may happen if they are advanced enough to use a Field Strength meter and come up on a 80 meter (or 160, 40, 20 - any ham communication) in which the operator is running under legal limit.

Imagine, if Ole Teddybear was worth a C-Note when the meter went 1/4 of the way over, just guess what this guy with the aluminum farm on top of that metal pole will be worth with this ole meter laying over in the corner.

I know that there is a certain animosity between some hams and some 11m ops, but this door swings both ways. It doesn't take a lot of imagination to realize that possible abuses of this measure will affect the ham community as well.

You can vote with your silence, and let this go through.

Before y'all start drooling and wagging your tails, remember it is only a bill and we all know the chances of this thing actually passing. Even if Hollingsworth himself squeals the loudest, my prediction is this will fail, and fail miserably. The FCC is not one of the governments favorite entities and this goes back to the Nixon administration. Don't bother calling or writing your congressman (unless you are really paranoid, like me) because this bill is dead before it hits the floor. Trust me. If I'm wrong, y'all can feed me the biggest plate of crow y'all can dish up and I'll eat it like a man, but this bill is dead for many obvious reasons. I can almost guarantee you the LEO organizations themselves will oppose this vehemently, let alone some of the more savvy lobbyists. Simply not a priority. Nice thought, but so is a pot of gold at the end of the rainbow.....

6643. Hello! Still looking for a Tram D-80

Subject: Re: Exportsrus

Well, here's my perception of this poor Whiner:
Chunky Boy, with his small defective little organ couldn't handle it!
Chunky is sounding more and more like a "gutter slut" every time he post's a message.

What a waste of a Ham License.

Chunky,

BTW.....The name "Shane" has so much more sophistication than Chucky! And Chunky....I promise you Shane is not gay!
Much more of a man than you'll ever be. He does not have to brag about his accomplishments like you so desperately seem to need to do.
hehehe

I have been away way too long!!! Give it your best shot Chunky and do without profanity.
I can't wait for this one!!! Let's see if he can do it!

I found a great replacement at my local "Pic-your-Part", or as some folks
call it, the junk yard. Maybe I was lucky. I noticed a big difference right
away. I also had to add a couple of noise reducing measures too that I
didn't seem to need before. Trade off but it's worth it!

Variable power "kits" are sold all over. I've seen some funky ones though.
If you buy from a reputable company they'll usually tell you what works and
what doesn't. Try Left Coast Radio, Bill's Two Way, Exports 'r Us or
Panther.

TH,

I must be missing something here. What is the purpose of "keying" on somebody? Is that their only claim to "bigness"? I mean, I truly can't understand such goings-on. I mean no harm, but on the surface, it seems infantile and childish behavior. What purpose is served by it?

Jerry

What class of operation would this be in Class C ? Class Ab-1 ? Would this not make a difference to the output seen with only "x" amount of drive available. How can you say he will see 1000 watt dead key, does his current amp produce 100 watts rms or peak? Is he looking for 1000 peak or 1000 rms watts ... What if he keys the "driver amp " at 50 watts swinging forward to 100 rms still think it deadkeys 1000?

So what you are saying is that when me and another station are battleing it out on the bowl and we both are coming in "heads-up" to a station in dx that if i go to the pump and put some more fire in the wire it is the f- layer doing it and not the extra few k's that i might be putting out

Could one of you kind sirs point me in the direction of a wiring diagram for this radio? I guess I just don't have the smarts to do it on my own. The wiring that is. I've searched all over the darn 'net.

TIA,

Jeff

It is like bragging rights, big penis envy, what ever you want to call it
but it is just the same as when locals keyup on certain individuals when
they are talking and say your not talking, no one hears you, go lay down
mudduck, your on the back of the bus, he's on hold, tell him who you hear,
etc It is called superiority , but it is the same in ham radio when you are
contesting you want your call to be heard and if there is a pile up how do
you break the pile up usually you go to the pump .. if you have an amp that
is capable of more than 1500 watts and you arent busting the pile up I would
expect the knob to go a little more to the right until they call your
numbers ...

know

Many people mistakenly believe it is the
> "watts" that make big signals. <<snip>>

Guys,

All this talk reminds me of something that happened several years ago. I am telling this all in fun and with the hope that everybody will get a little giggle out of it. Seems I was at work one day when one of our contract truck drivers arrived to take a load. He saw my little 2 meter hand held on my belt and began to make fun of it. "Why, that little 'piss ant' radio wouldn't get out two miles! Now my 600 watt 'leenyer' would squash that l'il ole thang!" I dunno, but it kinda caught me wrong, and since I hadn't said anything to him, I decided to play a little trick. I "baited" him by telling him that I just betcha I can talk farther with this "l'il ole thang" than he could with all them "big" watts. He bet me $100.00. So, I picked up my little 2 watt hand held and put out a call. Clear as a bell, Lexington, Ky promptly returned as clear as if he were standing with us. (yes, I've omitted something-we'll get to that shortly). Now we are in Charlotte, NC, and when the Kentucky station told his QTH, the driver's eyes got big, he turned several shades of green, red, finally blanching pale as a ghost. It was all I could do to keep from bustin' out laughin', but I held my composure. It literally floored the guy! "H-h-h-how did you DO that?" He knew he had lost the bet, for at that time of day, and knowing the conditions on 11M at the time, he also knew there was no way he'd get to Kentucky. OK, here's the trick. He pissed me off, right? He made fun of my radio. OK. What I failed--no, deliberately did--was to omit the repeater. It was on Mt. Mitchell, NC--the highest peak east of the Mississippi. With that repeater and a little handheld, one can talk to seven states with telephone quality. The driver left quite unhappy with his system. BTW, I didn't take his money. It would been grossly unfair to have done so. I didn't want money--I just wanted to get even with him for mocking me! LOL! I truly hope everybody gets a chuckle from it. Radio is lots of fun and in many ways. Please don't take offense because none is intended.

Toll Free,
Close... But you forgot the efficiency of the radio.
Actually about 100 out. Amplifier, about 600wPEP. To a
bugcatcher that tended to short if you ~did~ have a few
bugs on it. Very nasty amplifier... okay if you were
mobile, but if you were sitting still, where they could find
you... bad news!

Hell,

You need two things:

1# An alternator with working voltage regulation
2# An alternator that produces a bit more than 35
amps of current.

The fact that the voltage drops when you activate
the amplifier should tell you.

You don't need more V/voltage, you need more I/current.

That amp is going to draw 20 - 25 amps of current
before it starts to produce the rated power, and you
expect a 35 amp alternator to do the job? How much
current do you think it takes to run that trucks
electrical and charging systems?

Go buy an alternator.....

While am at it.... if you'll go back and read this entire thread the ONLY reason I got into this fray was because I stated my opinion on the X-force amps... which is my personal opinion of ALL of these amps on the market. and except for the one's that are ham radio use... further more, you people are trying to make a liar out of me, and it'll never work, I owned a Taxas Star Amp, This was BEFORE I upgraded to General. and I used it on CB in my car. Not to Step on people, and not to be an asshole, just to extend my range... I also used it on 10 meters. (once and a while) I've never owned and will never own, a 3-500Z box, not in this house, at least not one designed for CB use. Might get me a box designed for Ham Radio Use down the road, as far as my flaming of TOLL FREE? He started it, I didn't I stated my opinion and he got personal and started calling me an idiot. and that's why I did what *I* did. BTW: I am keeping copies of all message leading up and after all that I did say... and if MY ISP has any questions, I will be more than happy to show that what *really* happened here and not what *YOU* people want them to beleive what happened... My point? Just because *YOU* don't agree with *MY* opinion, doesn't give *YOU* the right to call *ME* names... just becuase *MY* opinion throws a rock into *YOUR* livelyhood (of building amps)...

have a good one...

> was abandoned long ago. <<snip>>

Twistedhed,

The 26 MHZ area is NOT abandoned as you might think. Regardless of how much they use it or don't use it, it is still assigned to the military. FCC doesn't govern these assignments. The allotment of military spectrum is handled by NTIA (National Telecommunications Information Agency). One user of this area is Civil Air Patrol. While the exact frequency(s) is in the public domain, as a member of this organization, I am not permitted to reveal the exact one. This particular frequency is used for short range comms and is known as a "reliever" frequency. This is to keep local traffic from interfering with other areas on repeaters, and is sometimes used on USAF SAR missions to prevent scanners from monitoring us. Why so "secretive"? For example, it would be a horrible way to find out that your relative has crashed in a light plane and did not survive. How would you like to hear of your loved ones dying just by hearing it on a scanner?

Now (didn't we have this conversation before?). Military comms (and CAP comms ARE military comms, are governed by USAF, and operate on USAF frequencies) are usually short and to the point-sometimes lasting only a couple of sentences. To hear traffic on these freqs, you'd have to be johnny-on-the-spot, so to speak, to catch it. Regardless of the "squatter" mentality, those 26 MHZ freqs ARE assigned and ARE used. CB stations have no right to be there. Period. This is a problem that WILL be dealt with. Overseas stations we can't help. Domestic "bootleggers" CAN be dealt with. And, as a licensed user of the 26 MHZ USAF frequencies, if I am prevented from passing legitimate traffic by a domestic "bootlegger", do not think for a minute that I won't pass it up thru channels to USAF Frequency Management. Indeed, if it is local, I will provide his location as well--in a heartbeat! And to Hollingsworth as well. If that sounds like I'm being an a##hole, so be it. There is no worse a##hole than someone who thinks his jabberjaw hobby is worth more than someone's life! And that's what those frequencies are for. No matter what anyone thinks of the propogation characteristics of 26MHZ, they have legitimate uses, and ARE used. The concept and philosophy of the users (and the "bootleggers") are different. After all, if you, the readers, were being interferred with, or were aware of the possibility, YOU wouldn't like it either!

Jerry

TH,

Actually, they can. You are right that the first offense most likely will bring only a warning. The point I was trying to make is that some people, knowing little about DF technology, think they can't be found. But, you and I know that they can--even if they are mobile. A small amount of MI probably won't bring down the roof. But if he keeps it up, it will. BTW, we had been hearing a MI on the repeater that I call the "Music Man"--liked to play loud rock music. Strange. I haven't heard him since we found him.

Maniac9188,

Your friend knows what he's talking about
and so does Lil'Bump. The White Lightning
4 Element Quad will literally "run circles"
around the 4 Element Moonaker.

I'll soon be installing the SE Lightning 8
Element Quad on a tower at a boom height of
precisely 74 feet. Anyone interested in being
involved with on-the-air testing of this system
is directed to contact me via email for further
details.

All heard will be welcome!

Game,

I still don't get it. Doesn't make anyone "better" than the other. It's just like arguing about cars. One time the Ford wins the race, another the Chevrolet. One time the Ford breaks down, another the Chevy. I'd say they are both about equal, but I happen to prefer the Chevrolet for my own reasons. It is a moot point.

I would likely take more pride in my ability to build nice oak cabinet-try in my shop, or the nice landing I made in a Cessna 172 than the ability to key out somebody who's trying to use their radio. It still seems like a small, infantile way to feel "big". Just my .02.

Drat!

Bad and misleading grammar. I should've said, "found THIS guy". I
don't know it's the same one.

Jerry

tim you also will not hear a good sounding radio on 27.025 .

strong radios , yes , but not good sounding ones . buy the time they are done
driving there 32 pills , they are only using about 13 % of the origional signal
.

---clipped---

Sure it will! Actually, it takes a lot less than 48 watts of
drive to get 100 watts from a '2879'. 13.8 volts in a 'normal'
no-load voltage reading from a 12 volt battery (and power supply).
Nit-picking over 1.8 volts is a bit silly isn't it? Especially
when that 1.8 volts makes such a small difference in final out-
put. If you use the transistor per manufacturor's specs', you
are ~always~ ahead of the game...

<<So what you are saying is that when me and another station are battleing it out on the bowl and we both are coming in "heads-up" to a station in dx that if i go to the pump and put some more fire in the wire it is the f- layer doing it and not the extra few k's that i might be putting out>>

Exactly, dude. If by "k's" you mean watts, that is correct. The whole channel 6 skip phenomenon has less to do with power output than it does with the shifting f-layer.

Don't take my word for it, check it out for yourself.

As each new station seems to bust through the pileup, it is soon submerged by another new station. No station will stay on 'top' for more than a couple of hours, and in reality, it's often more like a couple of minutes.

So does this mean that every station you hear coming out 'on top' has increased his power to overcome the previous station that was 'on top'?

It doesn't take a genius to figure out that there soon would not be enough power in the world to do things that way. So there has to be another factor at work. And it is none other than our friend, the ionosphere and its associated f-layers.

You can go back to believing this fire in the wire nonsense, or you can check out the real deal, it's up to you.

Heheh..I started to smile when I was reading that, Jerry, thinking "didn't we do this before?" Then you remembered too. Yea, I should have been more clear...allocations are still assigned and I shouldn't have used the word, "abandoned". What I should have said was most were nearly abandoned. Technology reached a vantage point that almost renders that type of communication extinct in true emergencies and before you cite a specific incident, I concede and believe that it does occur....RARELY. I also have respect for doing what you think is right, regardless of who thinks what. In a life and death situation, there are many more reliable modes of communication than on the 26 megahertz band. I am not advocating it is ok to squat here, either. Point I am making here is that one should be prepared to take responsibility for one's action and the actual chance of one being caught or turned in by someone like yourself is almost nonexistent among the thousands of dxers that occupy this space. The exception to that would be as you say, someone unfortunate and ignorant enough to do it around you locally, from a base station, or one who interferes with an extreme emergency situation, one that would warrant a location fix and then follow through with both barrels. How many times have you turned someone in? What is the percentage of convictions from your efforts? I am not attempting to be facetious in any way, but am trying to point out that your fears are exaggerated and the scenario you describe occurring is just not the norm and that the chances of someone actually preventing your communications, well...lets just say that if our military is incommunicado due to the occasional errant Dxer, well, what exactly does this say for the agency that employs you?

twisted head,
better listen to jerry. regardless how dumb of a choice it is to use 26 megs for CAP or anything else these days there are on occasions CO's silly enough to try and use it and then get offended because a cb'er is there. now granted we all know it is not a wise choice for them but in there little minds since they have official permission to work there they feel everybody will just clear off for them. this is the real world and people dont always do what you want. i would advise of staying clear of the CAP freq on 26 megs because as i said somebody is dumb enough once in a while to try and use it and you really could do some harm

I want to get a CB for my truck (Nissan Pathfinder), and I have no clue as to what is good and what is junk. I want a good radio, not some cheap piece of crap that will just piss me off. I'm looking to spend about $150~$200. At first, I'll mostly just be using it on the highway, as I've gone on trips with friends who had an old one and found it very useful, as well as entertaining. So I don't need something that will broadcast halfway across the country, yet. Just something reliable, that will keep me interested, let me know what's going on up ahead, and allow me to possibly expand in the future, if I'd like.

I'd like to have this in time for an upcoming trip I am taking, where I will be going to Canada, which brings up another question. Do I need to do anything special to enter Canada with a CB? I can't imagine I would, but I'd rather not get to the border and find that I have to remove the radio or something.

Thanks for any help you all can provide.

Alex

So what... I'm a ham and a CB'er. If you feel that it is so important to come to this NG and brag, you're one shallow son-of-a-bitch. Furthermore... while yes, CB is kind of wild, it is fun. Hams take themselves *way* too seriously. BTW... I have yet to drive down the highway and have a ham tell me where all the traffic is.... Even with those rolling earth stations that we sometimes drive with the rooftop antenna farms. Lighten up, Geek.

The AL-811A was dropped by Svetlana, as well.

Cetron and a couple other manufacturers all make them as well.

When it comes to replacement, you have more options with the 811A amps,
since they can run the 811A tubes, as well as the more rugged 572B.

However, don't just get a quad 811A amp, replace the tubes with 572Bs, and
expect gargantuan power increases. I see about 10 percent, but the box runs
a hell of a lot nicer (cooler, and the tubes are just loafing)

I had decent luck with Cetron 811s as well.

They are damn near a clone of the earlier RCA bottles.

Charles, I just don't think we are thinking on the same plain here. Ask yourself the following questions: What is RFI? How did the RF get into the great ether? Did it not radiate from some device, and if so, what was that device?

Charles Davis wrote:
OK.

So Chucky,

How do you explain my situation. I am creating RFI with my neighbors stereo
and I am using a Solarcon A-99 antenna. So I switch to a Mosely T33 Jr.
someone gave me and the problem goes away and everyone is happy?

Barry D.

The word is since, not sense. I knew the tests were getting easy, but this is insane. Who cares? Half of the problems on CB and ham radio are the idiots devoted to 'DX'. Ok, Barry Goldwater handled a bunch of our phone patches back to the states from Guam. God bless him. We appreciated it. So what is your contribution to amateur radio?

Ya I hear you, Bob isn't always on and I sure you could reach across the
pond with a delta force and a vertical antenna. I agree with you about
hearing europe on #38 LSB most of the european operators are on USB.

<< Yea, I know what yer saying x, ya' can't create yer own conditions. No argument there. But if the DX is running in his hometown to mine, he still won't be heard on the bowl. Too many good folks will key on his type...can you say "quack"? I stand by my original statement. >>

This is more of a myth than you might realize. 11 meter propagation shifts rapidly during a 24 hour period. It changes who is heard, where they are heard, and how strong they are heard. Many people mistakenly believe it is the "watts" that make big signals, but what you are actually hearing on channel 6 is the f-layer shifting as it favors reception of one station over another.

6708. Please HELP Me!!

I wanting to purchase a mobile cb radio , I am going to be in and out of different vehicles and and wanting one that is good for that and has all the bells and whistles and that can be hooked up to a DC source.

and also what is a good cb antenna for the car is it the K40??
please email me directly

thanks in advance
gregg

i don't think 48 watts of drive will yield 100 watts per device at 12
volts. i dont think many people run anything at 12 volts most power supplies
run at 13.8 or higher

How can I get more voltage for my mobile liner?
say 15-18 volts into my galaxy 250 HD. Right now
i am running directly to the battery but my voltage when running
is only 13.47v, and on dead key it drops to 11.9v or so.
Its a small pickup with a 35amp stock alternator (new) and
new voltage regulator (coil relay type) 79 ford courior with a
mazda engine.
I have heard that with more voltage to the amp I can get more out
put. Its hardly even warming up. 75-85watts on deadkey, and drops
power then talking.

Thanks

Source record: 53092

Try using some REAL wire to the amp......like at least #8 from the battery
to the amplifier. If the voltage STILL drops get a decent battery.

<< Ok. Let me put it into perspective. You are somewhat preaching to the choir, here, as I am aware of tropospheric ducting, ionospere and atmospheric conditions, in other words, I understand propagation just fine. What I am saying, is if he is in, lets say DC, and the skip is running my way on the bowl from DC, he's getting squashed by a big maul that happens to be in the DC area! In this scenario, watts matter.....and he's qucked.>>

The truth is that the 1 s-unit or so gain that a big amp adds to an AM signal is not enough to rise above the hetrodyne produced by a dozen other AM signals transmitted on the same frequency simultaneously during skip conditions. Even 2 s-units gain would not add significantly to readability in this situation. Again, what you are hearing when one signal overcomes another one is the effect of the f layer.

But no one (especially the folks who plunk down their hard-earned cash on a 'big' amp) wants to believe this.

I have also run into that exact symptom when the regulator was bad,it
would oscillate between transmit and recieve as evidenced by the tx/rx
led having an orange color and flickering.
You would do best to try and get an origional MB3756 or the ECG
replacement.My main repair experience is in audio and video equipment
and I only use NTE products as a last resort if at all.I have had a
lot of problems over the years with improper cross,poor specs and
higher failure rates as compared to origional,sk and ecg replacements
for the same applications.The nte brand is more widely availabe
because of lower costs and higher profit margins.
Thats just my opinion and experience,but either way,try to get an
origional part#.

Start by using a power line that is ~large~, as in #4, or
larger. The 35 A alternator too small for powering the truck
and a large amplifier. Figure 35 A for the truck and at least
that much for an amplifier. That way you will only be 'getting'
into the battery part of the time, instead of all the time.
Increasing the voltage is not the way to do it. When you
reach the limit of the amplifier at standard voltages, get a
larger amplifier.

I have just purchased a cb radio for installation in my van. I am going to do the installation myself and I want to 'tune' the antenna to get the best reception/transmission. The antenna comes with an adjustment on the whip portion but I have never used a SWR meter before. Can some one please tell me where I can find instructions for doing this?

Bob Wilson

Instructions should come with the SWR meter if you buy one. If you borrow one
the person you borrow it from probably knows.

Au' contraire! Read the propagation literature that is available and you can interpret it any way you choose, that doesn't make it so. Don't tell me that an "s" unit doesn't make a difference. Just for the record, I don't blast a big amp. I went through this once before with someone who told me what I do isn't possible. Antenna, location, radio, (with the occasional variable). But there are plenty of amps that do blast, and they DO rise above the heterodyne.

It's Radio for Peace International. Out of Costa Rica

25.85-26.40 is the range for Broadcast Auxiliary. It overlaps the 25.6-26.1
11 meter SW broadcast band. There is a marine allocation at 26.100-26.175.

The part above 26.4 is allocated Fixed and non-Aero mobile (which the legal
part of CB is as well) and is CB in some parts of the world.

I would doubt there have been new STLs (studio-transmitter link) built in
that range in years. FM stations would not because the bandwidth won't
support FM fidelity. AM and SW are another matter.

Were I doing it, I would steer clear of the area below 26.4 (actually, I
wouldn't do it at all) first to avoid being a pain in the drain and second
to respect the political clout of the broadcast people. I would remember
that the FCC was tracking German subs in the Atlantic within a square mile
in 1940 from Grand Island NE (putting the data on the cable to Bermuda to
look like the Royal Navy). I don't know any more than you do but I would
suspect the state of the art has improved a bit since then. Do not wake
sleeping giants.

Same could probably be said for the SW band but the spots are so bad that
even the 21 meg band is not used all that much

Dick

May I second Alan's opinion? If you think about it, a voltage regulator is
basically an amp with a feedback loop. In other clothing, they are called
oscillators. They do require some effort to quiet them down even when they
are good. My guess is that the nte takes a lot more taming than the
designer of the radio had in mind.

Hello Paul. Are you still upset that the recent RA ruling on single band transceivers means that you, as a mere CB'er, cannot operate on 10 mtrs as you thought?.....har har. What a plonker.

NO NO this just says they must have probable cause. In other words they
can't just stop trucks and check them at random. The question is what will
be probable cause?

6733. Re: HR 2346 STATE & LOCAL COPS TO ENFORCE CB RADIO REGS

Newsgroup: rec.radio.cb
Date: 2000-09-26 00:00:00 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8qpues$l69$1@nntp9.atl.mindspring.net>
Source record: 53197

Thanks for the Kudos. I don't think that a lot of folks realize how much the law has been altered in the past 8 years concerning probable cause and the issuance of warrants where certain aspects of law enforcement are involved.

In the "hot spots" of current law enforcement, equipment or funds can be "arrested" (confiscated) without probable cause, no charges have to be filed and no warrant is necessary for the action. This broad ranging power was issued as a weapon for law enforcement in the "war for drugs" and the "anti-terrorism" measures implemented into law. In the case of law and interpretation, once a precedent has been made, vast shades of gray are spawned in the shadow of it's execution. All that has to be done for this to be the subject of the next no-knock, dynamic entry massacre is for a correlation to be drawn between any aspect of CB radio, or any action of a CB radio operator to an incident involving children's safety, domestic terrorism, drug trafficking or any of the new "Renoisms"; no matter how thinly associated the CB ops actions can be exaggerated to be.

I too, used to argue that law enforcement couldn't do certain things without proper preliminary steps, which would usually make the enforcement too difficult to execute. However, after watching the congressional record for a 3 month period, I found that this is no longer true. The worst thing about this realization is the fact that many bills are voted in without our representatives having actually read them all the way through, implementing law that they will violently deny until actually reading the legislation. A prime example is H.R.1491 passed May 9th, 1933 in an "emergency session" of congress from a single copy of the resolution red to the congress by the speaker of the house. No member of congress actually had the bill to review and the discussion was limited to 40 minutes before a vote was taken. Among the things in the bill: Adoption of Emergency Powers by the president which circumvented the constitution in times or :National Emergency" (We have been in a state of constant "National Emergency" every second of recorded time since, and the Emergency Powers Act has been re-extended yearly by every president since F.D.R. implemented it, making the Constitution not necessary to rule the actions of government). In addition, this bill made gold illegal to own (later amended by Nixon for limited gold ownership), took us off the gold standard and placed the equity in all of our personal holdings (mainly land ownership) as collateral for the money system since gold no longer backed it. It was shortly there after that most of our gold reserves were sold to the foreign market to fund the meteoric expansion of governmental departments that came in with the "New Steal, I mean New Deal"

Remember, there is no true freedom without the responsibility of the people to monitor what our representatives are doing to us (supposed to be for us).

I truly hope this bill doesn't go though. However counting on that to be fact, before the fact, is the reason that things like this are even a possibility. I wish I could count the legislation currently in action that were labeled "Not a chance of this happening" by key people in the loop of making things like this possible.

Sit back and watch history being made, or get involved and make history. Your choice. The first option limits the duration of freedom as we know it, while the second one insures its continuance.

First of all... class of operation does not dictate output power. It may have a slight effect on gain but does NOT impact the maximum power out. My figure was based on an adequate input drive to the amp and if you noticed... I did say 1KW dead key. That means no modulation. That is probably a realistic figure at regular voltage considering losses in transformers and such.

No rules really. You will find the truckers generally on Ch 19. The
Toronto React Group is on channel 9. 37-40 are generally used for USB &
LSB. Lately the skip has been coming in and you can hear the Superbowl on
Ch 6. I would say that's about it.

Could not give a 4 X

> transceivers means that you, as a mere CB'er, cannot operate on 10 mtrs

Hahaha, was I ever upset about it? No, you thicko.

> as you thought?.....har har. What a plonker.

Oh, you're majesty, please may I lick your boots and order you a big mack,
would you like fries with that sir?

> --
> Ged

As a mere cb'er I can sit back and use cb if I want for as long as I want
while your frequencies are slowly but surely taken off you. 2m and 70cms,
very quiet and 10 metres, no life at all. I wonder how long you will have
these bands before they get the chop and given to someone else? Who is the
plonker now?

Again, I ask you, What tape?!?!?!

and further more, you accused Allen Park Roadrunner of the same thing. and it was proven to be false...

Truth is folks, I have only had sex with two women in my entire life, Laura Gentry of Marshall, Mi. Whom I was dating about 4 years ago, and She's now remarried. and Pamela Walton, A Lady, I went to High School with, and whom is currently single, (because I choose not to get involved with her) Both whom were WELL over the age of 21, So, you see wilddumbass, you have absolutely not creditability here, so hit the road and stop the bullshit before I get a lawyer involved...

have a day, idiot.

I had my 78 amp alternator rebuilt to a 125 amp. That thing holds
14.5 volts at full tilt on a 667V! It was worth every penny. Now my
stereo doesn't dim my lights, and the wipers don't drop the voltage.

The difference? Cheapo rebuilds from Pep Boys are made by handicapped
people. They put the alternators together without regard to the way
the ends are turned. The same guts are placed in a 63 amp and a 94 amp.

After killing 4 in a year, I went to a local starter and alternator place.
Nothing like full voltage at a red light in gear with the AC on MAX!

In my area (Southern California) there are no SSB specific channels. Radio Mexico uses them ALL.

SSB is Ch. 35-40, isn't it? You begin on Channel 19. That is the Travelling or Freeway (big road) Channel. Here you find out what is going on on the roads. The rest are for talking base to base & car to car. Ch. 9 is emergency only, and only use 35-40 if you have LSB or USB on your CB. Dave

Barry D wrote in message ...
> Is there any general rule about who uses what channel? Ive just got a

> Thanks

No rules really. You will find the truckers generally on Ch 19. The Toronto React Group is on channel 9. 37-40 are generally used for USB & LSB. Lately the skip has been coming in and you can hear the Superbowl on Ch 6. I would say that's about it.

Mr. Xblank-blank-whatever,

It is ALREADY prohibited! YOU don't know what you are asking for, bud.
I can see it now: A legal ham being hassled, arrested, his equipment
seized by some ignorant, fat bubba sheriff who wouldn't know a ham radio
from a cell phone. The legislation isn't designed to have that happen,
but it WILL. It will become another way for corrupt cops to hassle
people they don't like--whether you've done anything or not. I HATE
this! It will open the door for restrictions on ham radio as well as
CB. If Congress is going to do anything, they should restore funding
to FCC and let them do the work they were created for, not open the door
for storm trooper tactics by local cops!

I don't believe the mistake came from a logging program. How would you know someone was dickhead By listening to him code? You refer to one of your contacts on 20 meters. Explain this one chunky, unless maybe you were a little higher up on the band and sent him an image. Then of course he would be a Dickhead after seeing a photo of you.

That's just on the VHF bands. I seldom use VHF. I have always been
partial to the HF frequencies. There are repeaters on 29 MHZ. They
make so much noise and beat heads together so badly, I can only stand
to listen to it for about 20 minutes--if that.

Get you A bigger Alternator First, Then buy you three 6volt batteries,
and a motor maul. then you can volt that Amp to 18 volts, just remember
one thing, If that box is not designed to volt it wont hold together
very long.

You know--I'd have to agree with you about the Cub. I have no fonder memories than flying one with the door panels open over the lake looking at the bee-you-tee-ful girls in their bikinis. WOW! Just cruisin' around at 65 per with the wind in yer hair on a nice summer evening. Or--------doing snap rolls and lazy 8s in a Stearman. Ah, those were the days. It's gotten too expensive nowadays.

Jerry

6770. Dead Key, Swing etc. - Terminology Explanation Please

Newsgroup: rec.radio.cb
Date: 2000-09-26 00:00:00 UTC
From: Richard Smith <rsmith@NOSPAMplaneteer.com>
Message-ID: <oA5A5.11057$YG5.23696@tor-nn1.netcom.ca>
Source record: 53284

Can somebody please tell me what "dead-key" "swing" etc. mean ? or if possible point me to a website with output waveform diagrams to illustrate what these measurements are ?

My guesses are that dead-key is an output power measurement for AM with no modulation (being as SSB unmodulated is probably zero or near enough), and swing is a measurement of the output power for a 100% modulated AM signal. Is this correct or am I off the wall ?

Thanks in advance,

Richard.

I was going to comment on the funding aspect in my previous post, but for whatever reason didn't. Since you mentioned it, the bill may be the vehicle that gets them the $$$$. Defeat the bill, acknowledge a problem exists, and throw money at the FCC to pacify them and make the bill go away. Isn't that the way things were done in the past? Throw money at the problem? But then FCC allocation of the monies must be stringently carried out for that to occur, and not spent on non-necessities.

<< It is ALREADY prohibited! YOU don't know what you are asking for, bud. I can see it now: A legal ham being hassled, arrested, his equipment seized by some ignorant, fat bubba sheriff who wouldn't know a ham radio from a cell phone. The legislation isn't designed to have that happen, but it WILL. It will become another way for corrupt cops to hassle people they don't like--whether you've done anything or not. I HATE this! It will open the door for restrictions on ham radio as well as CB. If Congress is going to do anything, they should restore funding to FCC and let them do the work they were created for, not open the door for storm trooper tactics by local cops!

Jerry >>

Ignorant fat bubba sherriffs seizing personal property? Cops breaking doors down? Storm Troopers in the streets hassling the "good" radio owners while the "bad" ones go free?

It all sounds very, very scary Mr. Oxendine. And a good reason to keep things the way they are (i.e. no regulation whatsoever).

Hm. Where have I heard this kind of rhetoric before? Can you say.....NRA?

> and licensed services such as GMRS or amateur radio. Should this be enacted, I
> forsee some radio licenseholder having his equipment confiscated (even if
> temporarily) due to local law enforcement ignorance on the services. This
> makes it bad law.

I agree with all that has been said here and
would note the following potential problems:

1. Local law enforcement has NO (zero, nada,
zilch) ability to do the proper monitoring
and technical gathering of evidenece to enforce
anything radio related, much less only CB.

2. IF this goes forward, can other services
be far behind as to enforcement being given
to local authorities? (e.g. FRS, GMRS,
MURS, ham, etc.)

> I do agree that 11m needs to be "cleaned-up." However, it should not be done
> in such a manner that harasses other [licensed] radio services.

And you can absolutely be certain that
if this does go forward that it will be
harassment to other services.

This is a case that ARRL must oppose...
if it hasn't done so already.

Cheers,
Bill K2UNK

That is correct Rich, un- modulated is the "dead-key" or dead carrier, or carrier, swing is what occurs when modulation is introduced, it can be either forward or backward swing from the carrier power you can set your carrier to be lets say 50 watts rms and swing forwards to 100 watts that would give you 50 rms watts of forward swing rms. Or you can set the dead-key of whatever your rf source is to 100 watts rms and have it swing backwards to 50 watts rms. backswing is less desirable than forward ("swing") modulation.... etc etc

Read it again. I SAID restore funding to FCC, the agency that has the people trained in communications matters, trained in the use of highly technical equipment for locating outlaws, and originally charged by Congress to do this very job! In the long run, it will cost less actually. About the time a few local counties and municipal governments get hit with a few false arrest and illegal seizure lawsuits, you'll see a great reluctance on the part of local law to get involved in this. Hence, the "no enforcement" scenario that you mentioned. We would be back where we started. No, this is a bad idea all round! I think some hams look at this with the "Well, them CBers are gonna get theirs now" syndrome and "We are better than they are, and them cops can't touch us. NaNaNaNa Boo Boo!" That's a crock of crap. It would affect everybody. We don't NEED more laws-we got too many now! The laws are already on the books that deal with illegal radio activity. All that needs to be done is to re-enable FCC to do their job effectively.

I didn't SAY monitor. I'm talking about transmitting on unauthorized frequencies. People are free to monitor whatever they choose (Thank God), but we can't be free to transmit just anywhere we choose. To interfere with legitimate communications IS criminal and should be subject to proper punishment.

All I said was that the USAF frequencies in the 26 MHZ area are in the public domain, but I am prohibited from revealing them myself. That's all. Just as in any organization, as a member, I have rules that I am required to follow, and that is one of them. Anybody who wants to find out ANY frequency can go to many sources to find them--even Radio Shack has books on US Gov't frequencies.

If your scanner doesn't receive SSB, it's worthless anyhow for that! Go get you one of those all-mode, all-band scanner/receivers from Yaesu or Icom. LOL!

6804. Upstate NY Police stormtrooping on Long Island

Newsgroup: rec.radio.cb
Date: 2000-09-26 00:00:00 UTC
From: Joe <joeamp@mindspring.com>
Message-ID: <8qr82i$e7v$1@slb6.atl.mindspring.net>
Source record: 53318

About 2 weeks ago I placed a my Kenwood receiver in my auto not to miss a rebroadcast of Ted on some short-wave program on the 40 meter band. Nugent is one of my favorite entertainer/guitar players, I have all his albums.

Wile traveling on the Long Island Expressway late at night I was "blasted" from the left lane by a very bright aircraft type light "blinded badly I swerved".

I was pulled over by 2 state troopers working the area for the end of summer.
who shined a flashlight in my eyes and said how much did you drink tonight ?
"Yes one bottle you see Snapple see that bottle on the console"
Why did you blind me ? (no reply)
I then was asked what kind radio was that and what I was doing with it, I explained
The Ted Nugent interview was coming across and he became agitated, and drew his gun.

I was asked if I had any weapons in the car and to step out slowly with my hands up at gunpoint .....then asked if they could search the car
"I said no, not without a county officer or Sargent video taping the search"
I was pushed on the floor handcuffed and detained in the back of a patrol car wile they tore my car apart.
They then said get we have an emergency call and threw my glove compartment contents, and papers on to the roadway
To startled I could not remember badge numbers/names etc
Bastards !

It terrible, this government is cutting to much money to state government, police are going after innocent people with all different ways to justify overtime or seize a car to sell.
Years ago in Long Island New York this would never have happened now these state road Nazi SS from upstate NY are coming down here with there sunglasses, hi boots, hats, mustache and huge appiteights.
They are total weirdoes with serious mental problems having this much power ?
What the hell is this country coming to!

Hey does anyone know it that interview will air again since I missed it ?
or a good similar late nite discussions and frequencies 12-3AM
Joe, Long Island

What the fuck does this have to do with radio, CB or anything else on topic?

I mean, sure, you had a SWL RX in the car, but it doesn't seem to revolve around the topic of this group at all?

The Galaxy web site has nothing to do with anything that has Galaxy on the front of it, unless it has DX as the first two initials of the name (Like DX66, DX88, DX 99).

The other models are different importers.

Check Paradynamics. They are the ones "importing" that counter.

I don't doubt your story. The single biggest organization of thugs are all within the ranks of the police force. To make things worse they all are above the law because they interpret the law any way they see fit..They get away with it because they all stick up for each other with their intentional blind eyes (blue code of silence)

Opinions are like @$$holes... Everyone has one. Yours always seem to
stink.

Wipe once in a while.

I don't own
> one, wouldn't own one that was made for CB, I was making a point, that
> those Texas Star amps are in fact overrated pieces of SHIT, I've owned
> one, I ought to know...

OK

So, you don't own an amp

And you say you WOULDN'T own one made for CB

But then in your last part of the statement, you say that you DID infact own
one.

Liar.

Oh yeah, lastly, you make the inference:

"Same goes for Texas "stepped on" Star

A friend of mine has thier "Sweet 16" in this car.... I could step on
him with something with a pair of 3-500Z's in it all day long! "

Either you didn't EVER step on this guy, or you did, illegally.

> the services. This makes it bad law.

First of all, the bill states that, "The Commission shall provide technical guidance to State and local governments regarding the detection and determination of violations of the regulations specified in paragraph (1)." Therefore, if done correctly, police officers should have enough information to inforce the law in a reasonable manner.

Second, as far as knowing the difference between equipment, the police officer only has to do one thing - check the license, which we're supposed to have with us anyway. No more of a hassle than having to show a driver's license when stopped.

Besides, defining a radio that is used as a CB radio cannot be not that difficult. For example, most of us could spot a CB with only a brief glance. With a little more time, most of us could even spot an illegally modified ham radio. Therefore, it should be fairly easy to write up a description that would serve as a guide to law enforcement also.

Therefore, I don't really share your concern. But, in the end, we'll have to watch this carefully to see how well it is working. Until then, I'm not worried.

You really believe so?

I had a Henry SS-750 here a while back.

It had trouble making 600 watts on a 200A power supply.

It uses 8X2879s.

I have also used the 4 device Henry amp. It had the same kind of troubles.

Call Henry about it, and they state that the power will rapidly drop off
when the frequency is increased.

Seems that my Messenger doesn't have that problem! Nor my Sweet Sixteen.

I have owned the Henry big SS amp, and worked on a blown small one. All
just junk. Built nice,
but they seriously need help in the power output department.

For those who doubt my claims, see similiar ones on the amps reflector.
Another gentlemen in California
had the same problems with a SS-750 that I had. Components soldered in
wrong, relays backwards on the input
network, etc.

No, they aren't junk, when run properly.

You can make ANY amplifier a piece of shit, but I would take a Texas Star or
Messenger
ANY DAY over X-force or Davemade if I was going to use it for serious SSB
use.

Hell, the Texas Star CW transmitters are FCC INSPECTED!

> I don't own one, I was making a point...

Kind of like I was. I never stated that you personally OWNED the 2 tuber.

You said that you keyed on it with a two tuber.

Knowing that you know little to nothing about a mobile AC box, I made the assumption
that you keyed a base box.

Reading comprehension is a bitch, but only when you don't comprehend what you read.

I am a Networking Systems Engineer.

The title is Sr. WAN Engineer / Security Specialist

Far cry from the claims you attempt to make here!

> that acts like he's fucking God when it comes to building amps and I
> gotta tel ya asshole, you AIN'T SHIT!

Yeah? When is the last time you saw an amp that I built?

I know more than you! I've done
> MORE than you

OK, tell us what you have done.

What major CB shootouts have you won?

What style amplifier do you build?

and I BET I COULD FUCK YOUR OLD LADY BETTER THAN YOU,
> DICKHEAD... AND YOU KNOW WHAT MOTHERFUCKER, I'D EVEN LET YOU WATCH!!!!
>

Hey.. Let's compare lives, shall we?

A. I HAVE an old lady... More than you can say
B. I have my OWN place to live (not living with Mommy, are we???)
C. I have ALREADY been a successful business owner, not some wannabe with a
website (that was closed, BTW)

And the list goes on, and on, and on, and ON.

> HAHAHAHAHA!
>
> NOW GO PLAY WITH YOUR CB BULLSHIT AND HAVE A NICE DAY!

Actually, I believe I am going to continue to work on the Unix box right
now, then make dinner, and after that, watch some TV.

Toll,

I can see one connection to the group. That is, that this could happen to any of us. Just like some other threads I've read recently. The Indiana ham that was arrested for having a scanner. There have been a number of cases like this. They ARE real. I've heard about it in Kentucky, Ill., Indiana, now NY State. That's why the "local enforcement" worries me. It'll give those storm trooper bastards just another reason to hassle innocent people--just because they have a "radio". I wouldn't give permission to search my car, either--not because I have anything to hide, but because those a@@h@@@s will tear up everything in there INCLUDING the radio.

No real technical ability needed to enforce this, Bill. A linear is a linear, which a CB'er is not supposed to have hooked up. Stop a CB'er. See a linear being used by that CB'er. Write a ticket. No great technical ability needed there.

> 2. IF this goes forward, can other services
> be far behind as to enforcement being given
> to local authorities? (e.g. FRS, GMRS,
> MURS, ham, etc.)

There is no widespread rule violations in those other services, and no widespread complaints about interference, so there is no demand for enforcement of those other services - therefore no need for a change in the enforcement rules when it comes to those other services.

> And you can absolutely be certain that
> if this does go forward that it will be
> harassment to other services.

Oh, I don't think so, Bill. Thats why we have a license in the back pocket, and why the FCC went out of its way to specifically mention that licensed services are exempt.

If anything, I think this will improve the situation for the other radio services. First, this law will draw a wider line between CB and the other radio services, which should mean that at least a few less people will associate our radio hobby with CB. Second, it should help to reduce the bad public impression that hobby radio in general has thanks to antics of the CB'ers over the years.

I'm all for this change. In fact, I wish it had been done years ago.

So would that mean "routine" searches of trucks at state weigh stations
by DMV for amps, modded rigs, and such? Or would there have to be
probable cause--a suspicion that this driver has used his radio illegal-
ly? How in the world would DMV determine that? Would they, upon find-
ing an amp in the truck, "presume" he has used it and charge him for it?
How? Still seems unworkable to me.

Jerry

The "folks" don't need to know the difference between channel 19 and
80 meters. A person authorized to use 80 meters has a license in his
back pocket, while a person using only channel 19 does not. Note that
this proposal specifically states that the licensed radio services are exempt.

Bunk. The average local cop has NO such knowledge.
I don't mean that to demean the local cop, but
rather to just make a statement of fact.

Do you think a Linear being used for CB
is labelled "illegal CB linear?" On what
basis does a cop know the difference between
CBs, hamradios, etc? The answer in almost
every case is that they don't. The linear
doesn't even need to be "visible" in any
case. The "linear" could be in the trunk
of a vehicle...in one's home and no cop
gets to see it then unless a search warrant
is obtained.

Even assuming this law went through, do you
think those that violate the law now will
just keep their linear in plain sight?

Easy to say now. FRS, MURS is too new to
have the problems CB has now. Regardless,
this is just the camel's nose under the tent.
Accept this and who knows what will follow
to the detriment of both hams and non-hams.

Sorry, I just don't have any faith
in local law enforcement dealing with
this issue...be it CB or any other
service.

Additionally, the law enforcement community
probably has little iterest in being the
enforcer of CB. The problem comes when some
local decides to go on a crusade.

Bottom line, we don't need this at all.

Cheers,
Bill K2UNK

I believe that this is a bad idea for one reason only:

Most members of the public, law enforcement among them, don't understand the difference between citizen's band radio, unlicensed business band ("jobcom"), and licensed services such as GMRS or amateur radio. Should this be enacted, I forsee some radio licenseholder having his equipment confiscated (even if temporarily) due to local law enforcement ignorance on the services. This makes it bad law.

I do agree that 11m needs to be "cleaned-up." However, it should not be done in such a manner that harasses other [licensed] radio services.

You have to understand the greater meaning of this house resolution...
the big picture.. this is the first time the FCC has relequished, or
actually shared, authority to enforce rules and regulate the use of
citizen's band radio gear to local authorities; up until this point, you
could do just about anything you wanted to without fear of prosecution
from anybody except a federal marshal. This is the proverbial "slippery
slope"; how that this first step has taken, more are sure to follow now
that the precident has been set.

in other words, if the law IS in fact currently restricted to commercial
motor vehicles, the next step will be to extend the scope of the law to
all vehicles, commercial and private alike. It just so happens that they
hit commercial vehicles first; the one and only reason that could be
behind this is the fact that commercial trucking companies have deeper
pockets to levee fines on that joe blow in his pick-em up truck.

a voltage drop is occuring because he does not have a big enough power
supply"read that as alternator" he never said what size wire he is using he
could be using 1/0 and still will have the voltage drop without a big enough
alternator.

The 48 watts of drive was for 12 -2879's not just 1 of them Ill say it again
real slow 12 volts to 13.8 /14v which most cars charge at is nothing to
sneeze at If the extra volts do not make a difference then why do people
volt there amps ...

Ok, I just re-ran my 10 gauge wire from 25 feet or so to 5-6 feet max. Now I am getting a bit more power, as far as the alternator goes, that will most likely stay the same, I will just buy a new one when this one dies from the abuse ($26) cuz I can't afford a bigger one, if one will fit.
As for dead key what do I do? How can I make my dead key on my radio around 1.25-2watt with a pep of 10-12 watts (RMS) I have electronics experience but this old President P220 has alot of circuity in it, and some of the adjusters are for frequency only. What would it cost to have my radio re-tuned and moded for this amp to produce what the amp likes or is it worth it for this radio with the larger finals.

Thanks

<<`(B) A regulation that prohibits the unauthorized operation of citizens band radio equipment on a frequency between 24 MHz and 35 MHz.>>

<<Thank God.....At Last!>>

sure am glad it don't say anything about 10 meter ham equipment on citizens band frequencies .

don't thank god yet X34956171135 , making something illegal don't mean people are not still gonna use the stuff .

anyway X34956171135 the bil specifies commercial vehicals , and they must have just cause to search .

so the cop cannot knock on your door and ask to see your equipment . i have not let a cop search my car in years , cause i don't have anything , the most he can do is have a dog walk around your car , and when the dog doesn't smell anything he has no reason to search your vehicle .

leave well enough alone , bigger finals are not gonna do anything till you get a bigger alternator . and bigger finals is a death sentance for your radio , if its not done right it can dramatically shorten the life of the radio .

if you want to get out farther , get the best antenna you can . the antenna can make more of a difference than "volting up" .

can i ask what kind of antenna you have now ?

<<remember it is only a bill and we all know the chances of this thing actually passing. >>

True, but this bill or some form of it has been resubmitted time and time again, which proves that there is a real problem with RFI from CB linears, especially in some parts of the country.

Read the background from Cong. Ehlers re: citizens in his district being plagued by RFI from CB ops. The fact that the bill keeps coming back means that there still is a problem that needs a solution - i.e. CB ops unwilling to address RFI-causing emissions.

The ARRL encourages and educates hams to solve their RFI problems and hams can have their tickets pulled if they get complaints lodged against them through FCC channels. But there is no such control that encourages CBers to be responsible to RFI complaints.

Many CBers are good guys and try and keep peace with the neighborhood. But there is a bunch that don't give a crap about the neighbors. I agree with the legislators that such a bill is needed, and someday this bill or one similar will eventually pass.

This bill WILL NOT GET PASSED. Period! LEO's have more important things to do than police the cb airwaves. Trust me, I am a LEO and a cber. I do not want to have to police my community and the cb at the same time. It will not pass, they tried it not to long ago and it didn't pass.

Well Alex,

I would recomend a Galaxy DX-959 or a DX-949 with a Wilson 5000 magnet mount. that's about the best "non-export" setup that I have ever used. Below are some links for reference. Good luck and God bless.

Reality check time: Do you think that local law enforcement is going to waste their time enforcing CB regulations? Just imagine a judges attitude towards issuing a warrant for such an offense! In case no one has noticed, law enforcement is overwelmed the way it is. It would be only on very rare occasions that local law enforcement would even act on a said offender. It would be the 1KW guy that is taking out every phone, TV and telephone in the neighberhood that has been warned on a number of occassions. This law will be laughed at by the average street cop. In my city we have window tint laws: Not enforced! We have sound ordinances: Not enforced! Fireworks are outlawed here: And on the 4th of July the skys are lit like WWII. This is another example of a federal law dumped on city and state law enforcement. I would rather have my local law enforcement catching bad guys than worried if John Q Public is running a 200 watt linear...But then, that is just me!

P.S. Buy the way, while your local police officer was arresting your neighbor for his Galaxy radio, your 2 meter rig was just stolen out of your car...You better run... you might still catch'em!

Look, I really doubt that cops are going to run around kicking down doors, or stopping drivers at random, just to look for a linear. Cops are simply too busy to worry about such trivial matters. Instead, most searches of the home will follow a complaint made by neighbors, or during a search for other issues. The same with traffic stops - the stops will generally be for other violations, such as speeding or possibly even random DWI roadblocks.

> [snip] My own form of personal gratification
> is a little more complex than that, and relies

> protection of those rights. [snip]

But I just don't see how a right is being violated here. A person does not have a right to use a linear, or to use frequencies not assigned, so there is no right involved there. And I don't agree with your, and Bill Sohl's, dire predictions of widespread police abuse, so I don't agree there will be a loss of rights there. And certainly licensed ham operators are protected, so again no loss of rights there. I just don't see a big problem.

I'm quickly reaching that age where there are very few things in this world that would surprise me. And I'm also taking a "realistic look at the measure and it's ramifications." The problem is that we seem to be looking at different things. I see a problem (CB radio abuse) that has existed for years, and which has defied all attempts to fix up to this point. Because of that, I think it is past time for this measure (it should have been done years ago).

And this opinion is not based on some animosity between myself and CB'ers. I have a long history of CB radio use (1977 - license KBEO-0299). And, even as a CB'er (ignoring my ham license), I think the service has gotten way out of hand over the years and is long overdue

for some serious enforcement. And I think this proposed law is a great step in that direction.

even if this law pass's . it doesn't mean that your state will choose to make a law of there own for the cops to inforce .

and the search and seizure laws will not change , a cop cannot search your vehical without probable cause . if you say " no officer you cannot search my car " the next step will be them getting a dog . and i don't thenk a dog can be trained to smell an amp . a cop will not be able to pull you over for having a cb antenna on you car .

all of this discussion is basically stupid untill the bill passes , which can take years , and the bill WILL be changed as it works its way through the house . and after that , it will take months or years for states to pass there own laws . then it will take time to train officers .

An MP on a military base in California tried to impound my dual-band
mobile rig. I requested he wake his superior officer and let me talk
to him about my FCC issued Amateur Radio License. The officer read the
riot act to the MP and I continued on my way with my dual-bander
undisturbed. :-)

Why would you doubt it? They do it now for drugs that are less harmful
than alcohol or tobacco. They do it now for drugs needed by terminally
ill people. Even if they find zero drugs, they will confiscate your
car and money and accuse you of intending to buy drugs with it.

Dwight, you are one of the naive people who are going to wake up one
day, realize that you have lost all your freedoms, and wish you had
not given them up without even a whimper. Or maybe you believe you
will be one of the elite when the fascists take over.

> And I think this proposed law is a great step in that direction.

Bend over, put your head between your legs, and kiss your a$$ goodby.
If you are for linear amplifier confiscation then, for *exactly* the
same reasons, you must be for gun confiscation and for confiscation
of anything else deemed not desirable by the feds.

I have a Motorola Micor 330 watt low band repeater for sale.It is in
working condition in a 6 foot cabnit.It is presently on 46.5 rx and 39.9
tx.I have the instruction and station manuals.I am open to
offers,shipping
would be a problem and would prefer local pickup in S.E. Florida,it
weights
abt.300 lbs.The manual indicates an operating range of 25 to 50 MHz @
330
watts,I don't know what would be required to put it on 6 meters but it
would make a nice machine for it.The repeater is in very good condition
electrically and physically.The part numbers below are from the
individual components.

well, AFAIK, it's almost like a Galaxy 88DX. It has AM/FM/SSB/CW, it has a freq counter and I believe the extra freqs. It doesn't have any echo or rge beep. I think the power is that of a low power radio. 4w, 12wPEP

get a lawyer involved asshole i allready have one, dick weed you
started this whole thing and i have about 30 people e-mail me wanting
to no what your problem is , you think you no everything and you dont
no shit.maybe you should show up in court on oct the 15 to see what is
happening to coondog for all the shit he is trying to pull.
hay chuckie ask your so called lawyer about defamation my son, you
have been pulling the same shit asswhipe and i got you to big boy.
so let me fill you in a little big boy,, Defamation occurs when a
communication (either oral or written) is made about a person that
tends to so harm that person's reputation as to lower him orr her in
the estimation of the community or to deter others from associating or
dealing with him or her.. Defamatory statements in written form
constitute libel: and the penalties are great. ever sence i got on
this NG i have copyed every statement you have made about me and
others in the past 3 year's . so chuck the ball is not in your field
,it is in mine and always will me , because you do not no how to run a
business and all the legal sides of a business
chuck to avoid problems , your should think before disclosing
information concerning others.with out court written statements proven
the action.
so the bottom line is this chuck, you should get out of here a leave
everyone else alone . you do not no everything and if you did you
would not be living with mommy and daddy. so grow up.
and like you stated your creditability here is no good and everyone
know's it mr chuck adkins k8cap of stinken lincoln park.
you have a nice day

73's and god bless your little self

Kurt,
Four inches is a bit much to trim on a common CB antenna. It
may be that you've gone too far. You may be able to get a
replacement whip at the 'Shack', which would be cheaper than a
new antenna.
As was suggested in another post, you might keep trimming to
see if you can find a resonant point, at this point I don't think
you have anything to loose.
Another suggestion is to add a capacitive hat to electrically
extend the whip that's too short. Looks like a 'ring' that clamps
around the whip. Might be able to adjust it (up/down the whip) to
find lowest SWR.
Good luck....
'Doc

It does have a beep.
It is a dual final, high power radio.
I had one. I liked it but there were a few things that I did not like about
it so I sold it.
If you can find a used one for 200 to 250, buy it.
I don't think, IMO, that they are worth the 350+ asking price new.
I had a Galaxy 959 that was tuned up by a regular on this group that
performed just as well.
The Cobra has coverage from here to there though. For "Listening" purposes
only, of course.

Jeff

Just my opinion.

Shoot Cecil, I think the RICO act already gives them the right to break in (warrantless) and confiscate your equipment if they think it involves a "group conspiracy" to violate Federal laws, which of course could be almost anything. This is just big brother's next step in assuming total control of the horizontal and vertical.

You should be fine. If you are worried about customs, ask them for a receipt before you leave the USA, then they can't claim you bought it in Canada when you try to return to the USA. However, being as the US dollar is so strong they would probably think you were crazy to buy a CB up here anyway ;-)

Kurt;
If you are talking about the radio trunk lip mount antenna, I
installed one for a friend at work. I ended up cutting about 6 inches
off of it. Use the same rule you started with, if the swr is better
on a lower channel, cut more off.

What "freedom" is that, Cecil? The "freedom" to own a linear? Give me a break. CB'ers never had this "freedom" in the first place, so this "freedom" is not going to be taken away from them (you can't something away that a person never had)?

Good grief. There are no "inalienable rights" involved in the
ownership of a linear? And the Bill of Rights does not gives you the
"right" to own a linear?

Dwight Stewart (W5NET)

A lot of you have given advice while I have obsessed on what radio to buy. Its down to the RCI 6900F HP for $350ish tuned and peaked with 11 meter, and from President, the President Jackson tuned and peaked with 11 meter for $300 ish. The radio will be used 90% mobile, ch 19, while I am on the road, and 10% on ssb. Looking for a quality product that will perform well over the long term. Any final comments or recomendations? (yes I know to get the best antenna I can. Will be a Wilson 1000 or 5000 mag cuz I need to move it between cars). Thanks everyone for their time and patience with me. Nick

You really shouldn't have to cut ANYTHING off... if your antenna and feedline are troublefree, you should be able to buy one of those antennas and install it and have less than a 2.0 across the band.. You don't NEED a 1.0 or 1.1 on every channel..

If you're using it mostly on channel 19, I wouldn't bother getting such an expensive radio. Get something cheaper like a Grant or a 148... it also sounds like you don't need the "extra channels"... just get the audio going good (recommend a good power mike like the Astatic 575 M6) and maybe bring up the power or add a small amp... just my $.03 (inflation, ya know!)

I agree with Andi, however, this is a Radio Shack antenna. I bought a firestick like from RS and couldn't get it under 2.5. Spent and hour check different grounds and looking for coax shorts. I knew I shouldn't have to cut it and returned the junk.

Bought a Wilson 5000, and bingo, used the recommended length and had 1.5:1 across 5 bands and 2:1 on the 6th band without any further adjustment.

I agree with Andi....again. Nothing like running your car off the road trying to adjust the clarifier on SSB, plus the lower bands are useless unless you know Spanish. However, if you do go with either one of these radios, which I consider high end mobiles, do yourself 2 favors:
1. Spend the extra 20 bucks and get the Wilson 5000.
2. Set both cars up with the quick attach mounts, so you can easily put the radio in the trunk EVERYTIME you leave the car. I wouldn't leave either one of those in sight waiting for some asshole to break out the window and walk away with 3 or 4 bills worth of equipment.

By the way Nick, 350 is a great price for a peaked RCI6900FHP. I would have thought that to be closer to 400.

I missed the foot-warmer comment...partially because I don't have an amp myself, and partially because I haven't seen anyone actually mount one down there.

BTW, Jason, what do you define as "long-distance"? Never gauged the distance on my CB...but I'd guess 3-5 miles max. I don't see how anything out to 40 miles or so would be unreasonable, though.

You told me a couple years ago that nothing you did on the newsgroup would
threaten your
ISP because they where YOUR friends, remember?

Then you said that if I reported you, and had you cancelled, you where going
to do the same
to me.

I remained on my ISP (funny... I owned it)

I would go with the President and Wilson 5000. I ran a HR2600 for 10 years with a Texas Star 400 with it and it never was taken out of the truck for anything. Ran perfectly with the Astatic 575 m6 mic and had nothing but good clean sound out of it(reports from here to there). I run a President Lincoln now and still have nothing but good reports and it is hooked up to the 10 year old DX400 which also has not been to the shop for anything.

Bah

If that 1.4 volts of juice-loss (if that could be construed as a REAL
word... hehe) scares you, then you need to buy a linear.

Or, if you want to get REAL technical, get a 5 amp diode and wire it in
series with the positive lead...

Then you only lose .7 volts... Downside is the radio just won't turn on
when wired up backwards....

With the bridge, it will turn on, and work correctly, no matter which way
you apply power.

It's a nice little hf ham amplifier made some years ago by Hunter. You can see their old ads in vintage QST Mags. Long out of business but well worth playing with. They sold it as a kit, in various forms and power levels. You probably have the 4 811A tube version that some people put 572B tubes into if space allowed.

A lot of hams refered to it as a "poor mans Collins 30L-1" amplifier.

I've seen a number of them through the years. Seem to be pretty well done but the circuit could use some updates to work right.

cheers
skipp

You forgot 'impound linear'. Otherwise, CBer goes to court, & judge throws the case out for lack of evidence, since the prosecution can't prove that the device the cop saw was indeed a linear. That's why the cops in Virginia will impound your radar detector if they ticket you for using one.

At this point you have likely ruined the antenna, so just to satisfy your own curiosity, keep cutting until you find the low point at channel 19. You never said what the swr was originally on channel 1. How low did you get it?

Game:

First off, don't pawn your personal life off on me, I don't want it.
Just 'cause you and your buddies are queer, doesn't mean the rest of
the world is, too.

So sue me for trying to cover all the bases. A common mistake when
installing a linear, for some, is not using beefy enough wire for the
power leads.

There was no need for you to jump down my throat for suggesting that
his power leads may be too small. We didn't have that information, so
I covered it. While your statement was technically correct, in that
that alternator won't carry the amp and the truck, even with 0/1 guage
wire, you might want to take some congeneality courses, or maybe
creative writing. Who knows? They might improve the way people take
what you scribble.

This isn't the first time you've come back with a sneid comment about
something I've posted trying to help someone. If you don't like my
posts, put my address in the bit bucket.

I'll continue to try to help, and to try to cover all the bases.

Hello All: Again looking for a Beckman VR-1000, uses two 4CX250B tubes, and weighs a ton.

Jay in the Mojave

6922. QST:INVITATION TO 3 ANTENNA-RELATED LISTS (REFLECTORS)

Newsgroup: rec.radio.cb
Date: 2000-09-27 00:00:00 UTC
From: fractenna@aol.com
Message-ID: <20000927082443.21888.00000938@ng-cc1.aol.com>
Source record: 53438

QST--

You are invited to join one or all of the following lists on e-groups(formerly onelist). All these reflectors are e-mail based, friendly, objective, and moderated ,so that no spam, porn, off-topic, or personal-offensive posts are sent out. You will receive no off-list e-mails by subscribing: again; no spam. Occasionally free offers of antenna files and other info are presented, along with photos of relevant antennas (unlike most NG's you CAN do attachments).

These lists (with average recent subscriber sizes) are:

ANTENNAS@EGROUPS.COM 190 members
CROSSFIELDANTENNA@EGROUPS.COM 70 members
FRACTALANTENNA@EGROUPS.COM 260 members

Please review the descriptions at:

http://www.egroups.com

Please note the CFA list specifically deals with this antenna in an objectively critical fashion and no posts will be allowed that make grandiose claims without supporting data presented. To date, no data has been presented which requires the extraordinary claims made by some pundits: there is no evidence for better performance than any other small vertical antenna (and that performance is poor).

Fractal antenna posts should go the the fractal antenna reflector; not the antennas reflector.

To subscribe to any list, either go through the process at egroups, or to skip the process (and some say 'annoying questions') just do:

---------- -subscribe@egroups.com

where the ---------- is the name of a given list (such as 'fractalantenna')

If you have a specific question on this post, please e-mail me off-NG at chipn1ir@aol.com.

73,
Chip N1IR

> Bunk. The average local cop has NO such knowledge.
> I don't mean that to demean the local cop, but
> rather to just make a statement of fact.

I just can't agree with your rather low opinion of cops. First of all, cops are not born in a vacuum. And there is hardly anyone in the country that does not know what a CB radio looks like. They've seen them in Walmart. They've seen them on TV. They've seen the antennas sticking up everywhere. And a good number have used CB in the past. And a good chuck of those people know that no metal box is normally hooked to a CB radio. So, unless that box says "power supply," it fairly well narrows down what that box is.

And, you seem to forget that the bill specifically states that the FCC will give guidence concerning the enforcement of this. I'm sure that at least part of that guidence will include a sufficient description of a linear.

> [snip] The linear doesn't even need to be
> "visible" in any case. The "linear" could
> be in the trunk of a vehicle...in one's
> home and no cop gets to see it then unless
> a search warrant is obtained.
>
> Even assuming this law went through, do you
> think those that violate the law now will
> just keep their linear in plain sight?

And that is where the additional enforcement by the FCC comes in. They will continue to go after the hard-core violators, while the locals will handle the run-of-the-mill stuff. In fact, with the number of violators reduced by this, it will be even easier to locate the remaining hard-core group.

> Sorry, I just don't have any faith
> in local law enforcement dealing with

> this issue...be it CB or any other
> service.

And I guess that is where we differ in our outlook. You see possible widespread police abuse, while I see a possible solution to a widespread abuse problem that has existed for years. With our different outlooks, I seriously doubt that we would ever agree.

Source record: 53443

Method 1:

Strap the bases of the transistors straight to ground, rather than biasing them.

Drawback: This means SSB will go to shit.

Method 2:

Get a 12 volt regulator (one of the 5 amp TO-3 devices works GREAT). Run your bias supply off this. This will allow volting, while keeping the transistors biased.

Using either one of these two methods will get you to around 16 to 17 volts. Any higher, and your talking major changes to the tuning and such.

Toll Free

And that is where I object. Sooner or later, some LEO is going to "impound" a legal HAM radio and amp regardless of the "offender's" license waved in his face, causing said ham, rescue squad member, or fireman to have to take time off work, go to court, maybe hire a lawyer to "defend" himself. ....which costs money that innocent persons don't need or want to spend. Lots of trouble. About the time some PD gets sued for false arrest, improper impound, and ignoring procedures, you'll see how often the cops will want to get involved in this.

> "right" to own a linear?

Maybe you don't realize that linears weren't in existence when the Bill of Rights was written. But the *spirit* of the Bill of Rights gives a citizen the right to own a linear (or anything else) as long as it is not *used* illegally. Ownership of property, as long as that property is not used for crime, i.e. to interfere with the equal rights of others, is one of the cornerstones of this free republic which is being rapidly undermined and eroded by socialist/fascist politicians.

Traditionally, in this country, it has been legal to own a "whatever". It has only been illegal to use that "whatever" during the commission of a crime. Any deviation from that concept is a loss of rights.

> on SSB and CW.

Walt, have you ever had a problem with hash from the computer or monitor getting into the front end of the receiver? If so, how did you stop it? RTTY is one of my favourite modes and it's frustrating not to be able to use a modern computer, they tend to be very dirty RF wise.
In the past I have used pure TTL logic to decode and print it, and later used a Vic20 to decode and print to screen. That tells you how long ago it is since being able to use that mode.

Every citizen, CBer or otherwise, in this free country should have the right to *own* a linear. The only crime associated with a linear should be when it is *used* illegally. Anything other than that concept is a loss of an inalienable right which the Founding Fathers intended for free citizens in a free society. People who don't understand that simple fact better prepare for another fascist state in the world along with all the evils that accompany fascism. A book, "It Can Happen Here", predicted such, a number of years ago, and the previously free United States is right on schedule for fascism. Hope you enjoy living in a straight jacket, Dwight.

beaker,

I am sure they are going to do SOMETHING since they have been "rattling sabers" for several years now. However, this local enforcement stuff is just another way of curtailing the freedoms he have now. For example, seat belts. I totally agree that seat belts are a good thing. A seat belt saved me from serious injury in a large truck in 1977 before they became law. I believe in them. BUT it shouldn't be mandated by law. In order to remove the freedoms we enjoy in this country, the socialists and fascists know they cannot just say, OK, you now cannot criticize the government, or you cannot read certain books. It would produce a revolt that they know they couldn't win. So the process is gradual. By introducing laws that appear to be in the peoples' best interests and sound good, we are slowly being conditioned to accept constraints on our freedoms of choice, speech, and association (in the public good) so that the day will come when the public will accept total control of our lives by those (liberals) who just know in their hearts of hearts that "they" know whats best for the "little" people. It is also the heart of gun control. Until these people can get guns out of the hands of law-abiding people, they will never be able to control us. By using the crime issue (which is real, BTW), they get us to accept the loss of one more of our constitutional rights. It won't happen at once, but one day, we or our children's children will wake up to find that they can be marched off to "re-education" camps without any recourse. Hitler was able to circumvent the laws of Germany by making the people believe that what he was doing was for the good of Deutchland. It was illegal, even when he was in power, to march people off to camps, but it was done anyway. If a Wiermacht officer refused to carry out the order to kill "undesirables", do you think he'd get shot? No. Because the issue of insubordination was governed by German law (even during that time). If the officer was court-marshalled, then the question would be raised: Who gave the order to shoot people? Answer? Hitler! If he began shooting his own Wiermacht officers, then he would lose the support of the entire army, and his whole "cleansing" program would fail. So the officer would be shipped off to some other duty--probably ze Russian Front.

These seemingly "harmless" laws such as the local enforcement thing are just another step to controlling communications of all kinds. I am opposed to giving cops more reason to abuse law-abiding citizens. And that is just what will happen if this thing goes thru. It's what I've been saying all along. Somewhere, sometime, an innocent CBer, a ham, or even a volunteer fireman will be driving and swerve to miss a pothole. A big-headed, heavy-handed cop with an authority complex will pull him over on suspicion of drunk driving. (you know, "probable

cause"). He will ask to search the car for liquor or drugs. Whether
the driver gives permission or not, the car gets searched, the
upholstery gets ripped out, the carpet torn, and AH HA! He's got a-----
RADIO---well, I'll just take that! It gets ripped out of the car,
damaged in the process, and when the CBer protests, he gets slammed
against the car, cuffed, and taken to jail. When it's over, he does get
his stuff back, but who pays for the damage?

Hell NO, I don't want this! There are good cops, true, heck I know a
bunch of them here on our own city/county force. But there is always
the guy who becomes a cop just for one thing: Power and the ability to
intimidate people. He's the one who thinks he's God, thinks he knows
everything about everything, and NOBODY better dispute him, or BLAM!

Whew! Sorry guys, this thing gets me wound up!

Andy,
If the cops damage your car, destroy documents, ruin your equipment,
and find nothing, who pays? I, for example, have some VERY expensive
radio equipment (about $1500) in my car. If "der SS" damages that
equipment or renders it inoperable, who pays for it? Them or me?

Dwight, the last time I looked, the Bill of Rights specifically ensures that the feds have no power of regulation of the airwaves. The only _possible_ exception is the abused interstate commerce clause. If a signal does not interfere across state boundaries, disrupting commerce, this justification for FCC involvement falls apart as well.

Sure he can. He just calls it something else. It already happens in states
with restrictive mobile scanner laws. If questioned, the cop just says the
driver was weaving or otherwise "driving erratically."

What if that "random" DWI roadblock (an end-run around the Constitution in
itself, since it provides for stopping a vehicle without probable cause) shows
a sober driver with what the cop presumes to be an "illegal CB" or "linear?"

I find it ironic (and scary) that hams are crowing the loudest about this, yet they potentially have the most to lose.

How is a local cop supposed to know the difference between a Uniden HR-2510 that is being used LEGALLY by a licensed ham and a Uniden HR-2510 that is being used ILLEGALLY by a CB'er?

How is that same cop supposed to know the difference between a Texas Star 250 that is being used LEGALLY for 10 meter DX contests and a Texas Star 250 that is being used ILLEGALLY to talk trash on Channel 19?

Answer: THEY WON'T!

For those who say "just carry your ham license", I would ask that you take a look at the numerous cases of hams who have been harassed by police and had their mobile scanners confiscated...even though the statutes clearly show licensed hams to be exempt from the law. Why should this be any different?

I am a licensed ham and I understand the need to clean up CB, but I definitely do NOT want this legislation to see the light of day. If it passes, anyone with an antenna on their vehicle will become a potential target.

Be careful what you ask for, hams.

Joe
,
You could go to the SHP district HQ and find out who was working that area that night. They would have a log of the calls/stops that were made in that area and who was working there--that is, if the SOBS actually called it in. Just a thought.

Just because guidance is offered is no guarentee that it will be taken.
Additionally, there are plenty of other situations where officers FAIL to
enforce a law in a reasonable manner.

> Second, as far as knowing the difference between equipment, the police
> officer only has to do one thing - check the license, which we're

> show a driver's license when stopped.

However, since licensed services are exempted, the local law enforcement
officers don't have the requisite authority to request a licensee to present
his license, since their enforcement duties only extend to an unlicensed
service.

> Besides, defining a radio that is used as a CB radio cannot be not

And just how is one going to identify a modified amateur radio without actually
touching it (to tune or TX it), and just how would there be authority to do so
- since the equipment is normally used in a licensed service outside the scope
of their duties....

Hi! I am having some problems with the electric fans of my car. I have a 94 Sentra, 4 door. When I connect the antena to the radio and start the engine, there is no noise, but when the engine warms up and the fans start, the noise comes thorough the antena. I tried to solve this by powering the radio from another car battery that was not connected to my car but the noise still there. I am certain that it is the fans, and that the noise doesn't come fromt he power cable, because when I unplug the antena it goes away, even if the fans are working or not. I tried putting two capacitators in the power lines of both fans, but the noise still there. Some one told me about a "Band Filter", and I would like to know if there is anything out there that will help me to get rid of this very frustrating noise. Anticipated thanks for your help. My radio is a Midland 77-113.

I'm very glad you pointed that out, Dwight. Did you know that powers
not specifically enumerated in the Constitution as being the concern
of the feds are reserved for the states? The fact that no mention is
made of linears in the Bill of Rights or the Constitution means that
the feds have no legal right to regulate linears. They are in violation
of the Constitution when they attempt to do so.

Jerry Oxendine , this "bill" is no different than anyother bill going through than can turn bad . and sure there are good cops and bad cops . there are laws that they have to abide by to . i could give two shit about this law .

every single officer has the ability to get the fcc after you . alls he has to do is call the local fcc office , give them your plate # , and tell them that he think your equipment interfered with official communications . and the fcc WILL be looking at you very closely .

this law will bring nothing to fear , if it even pass's . and if it does pass , who knows what the final bill will have added on and taken away .

i am not afraid of cops , i have not let on search my car in years , there is nothing they can do about it . if they do break there own laws and search your car , fine , thats what lawers are for . every single piece of equipment in my car is easy to relplace . and the $ i get from sueing the cop , and the charges i press againt him will more than make up for any time i lost .

they can pass this law , there are ways around every law , loop holes .

Your problem is not uncommon. You have to stop the noise at its source. That means taking a 0.1uF capacitor and placing across the leads to the fan(s) as close to the fan(s) as possible. Use one cap for each fan. This will cut the noise considerably...

FS: JoGunn 3+3 Star 3 element Beam
Is used, but in very good condition
Includes a machined sleeve to reduce mast diameter to 1 1/2"
also have instructions.
$180

Here are the specs
TYPE: Horz. & Vert. Polarization Twin Feed
GAIN: 14.5 DB
FRONT TO BACK RATIO: 40 DB True
SIDE REJECTION: 40-45 DB True
BACK REJECTION: 40 DB True
WEIGHT: 28 lbs.
LENGTH: 8 feet
SWR: 1.1
HORZ. to VERT. SEPARATION: 20-25 DB
WIND SURVIVAL: 100 MPH
POWER MULTIPLICATION: 40X
AUDIO GAIN: 18 DB
WIND LOAD: 2.8

6964. FS: 4 Texas Stars

> is being used ILLEGALLY to talk trash on Channel 19?

I'm not in favor of the bill, but it is already illegal for anyone to use
a stock Texas Star amp. Even an Amateur.
An amplifier cannot have an RF sensing circuit to allow it to transmit.

Thanks to all who replied. I tried the Broadbanding mod on Rogerbird's site (220pF cap) but unfortunately, now the Chipswitch won't lock (error 4) above 29.6 and below 25.3. I haven't tried turning any screws because I don't have the proper service manual. I know it can do better than this!

Law enforcement has been reduced to 90% process serving and revenue
generation while mainataining 10% protect and preseve mode of operation
(Your mileage may vary). This is the new form of introducing revenue ino
the tax base. This is what new squad cars and COLAs are made of.

Unwarranted seach and seizure isn't an award given for civic achievement by
the local cop shop. You automatically assume guilt on the part of the
citizen, and you are saying the cops are going to be more subjective? How
are hams being protected? Please explain for the members of the newsgroup's
general enlightenment. Do you ever read the newspaper?

> >

I agree here is extreme abuse of the 11 meter band; actually eveything from 12 meters to 10 meters and all spectrum in between has been affected by the presence of "export" and 10 meter rigs. The main problem before the FCC now is how to address the current complaint registered at the WARC conference concerning interference to their alloted spectrum used for telephone exchange in Central and South America at the hands of American (and a host of other nationalitie's) radio operators. This is looked at as a violation of international treaty, and the FCC is literally at the corner of Walk and Don't Walk on this issue; they have to do something and have results before the next WARC conference. Due to the timspan between the WARC conference gathering, the playing field can change drastically between the convening of world representatives to manage frequency spectrum with minimal interference, which is part of what the WARC conference attends to. Between the last meeting and the one prior to that, the market has seen Export and 10 meter mobile radio manufacturing go through the roof, and radios that were never available at a reasonable price became available through a wide distrubution process within the reach of anyone interested enough to buy. I do recognize the need for attention, especially with the sunspot cycle peaking in the next few years, making a band the once limited transmissions to 150 miles now impossible to contain across the continent, even if using only a 4w, 40 channel AM only mobile rig using 85% modulation to a mag mount trunk antenna. In the meantime, manufacturing has been approached to limit the capabilities of rigs incoprorating 10 meters to not include AM. It could be added as an option with proof of valid ham license. The carrot dangled in front of the manufacturers was the lessening of the CW speed to introduce new numbers to the hobby. The increased licensed operators would make up for the loss of revenue created by the restricting of the export or 10 meter mobile market which has been perceived to be the major accelerator of the problem.

That is the need. The ramifications are much more widespread than the surface translation would suggest. We as a nation started straying away from the Magna Carta, which became the basis for Blackstone's definition of "the Law of the Land" used for interpretting the law. Early in the 20th century, Judge made lay began to emerge. With the introduction of the

Supreme Court, every decision (which was a variation of existing law interpretted by a panel of Supreme Court Justices) became the basis for further interpretation, which each precedent introduced further diluting the measure of the law. This be came the evolution process of law; adapting to the peceived changes in society. It is these precedents, once introduced into law by a Judge's interperetation of a previous interpretation ten times removed from the actual rule of law that become rulings that further interpretations can be extrapolated from.

"THE LAW IS IN THE JAW OF THE JUDGE"

Have you ever played "witches - brew"; where a statement was pass along verbally to a number of people only to be compared with the original statement for accuracy? If you understand the results of that game, you have a good basis for understanding how precedents become gospel; begatting further precedents until a completely new religion of law is executed on the citizen.

> And this opinion is not based on some animosity between myself and
> CB'ers. I have a long history of CB radio use (1977 - license
> KBEO-0299). And, even as a CB'er (ignoring my ham license), I think the

> for some serious enforcement. And I think this proposed law is a great
> step in that direction.
>

I had a 3X4 call; KZW-2340; that dates my association with CB. I agree there is a need for some more attention to the problem. The toal de-regualtion of the Citizen's Band by the FCC started the snowball going downhill. This measure is the equivalent of planting a nuclear device at the base of the hill. The snowball is reduced to millions of particles that can never be re-assembled to the original problem for a better solution to be used, and the fall-out remains for generations to come. This is bad legislation, and to allow it to pass will only generate more abuse in the future. This abuse, by precedent, will ultimately affect ham radio. That is an absolute given which you can take to the bank. History proves this pattern from the first sylable of recorded time... I have a harder time than others in ignoring this confirmed and bronze coated pattern. It is not conjecture, it can be researched and proven from any journey through the congressional record and we are all old enough to see the effects of this kind of expansion of abusive power. If allowed to pass, the abuse will compound exponentially. Mathematics is a finite science. Facts change descussion into debate by their mere introduction. I can't reverse this pattern by choosing to ignore it or wishing it would go away. Reality always steps in when I attempt to use that method to justify bad legislation.

And Echelon extends the monitoring to worldwide with it's central bank for archiving recordings. The recordings archived there are monitored conversations containing phrases in the word recognition software's "Hot List" When one of these phrases comes up in phone conversation, it triggers the recording on the mandated phone tap that is active 24/7 on every phone conversation. Look at the Domestic Terrorism act invoked after being "laid on the table" the week prior to the OKC bomb ordeal for the implementing legislation.

This is referred to as "arresting" the evidence. No search warrant required, no charges ever have to be brought forth, and no deposit/ no return of the confiscated item. Read the Crime Bill. I think it was HR3555 passed circa 1994.

The RICO statute has been abused to expand the powers of federal agents to state jurisdictions, doing an end-run on the 4th ammendment.

This is not new news, and has been documented in the abuse since it's introduction, including no-knock, dynamic entries resulting in homeowner death executed on the wrong address; as well as a multitude of other examples that seldom reach the mainstream press that is already predigested for you convenience before going to print.

This is the FACT that is never considered when a group gets together and spews it's interpretation of the law. The difference between inter-state and intra-state determines the federal involvement. Unless it crosses state lines it is state issue which can only host federal involvement at the state's request. The FCC does not have the authority to intervene in state's matters. I know of at least one standing warrant currently unexplored in which a sheriff gave the field agents the choice to go to his jail or leave his jurisdiction. After a quick call to their superiors, they were advised to leave town. The warrant is still open to apprehend them if they are in his jurisdiction on any state matter. He is smart enough to determine if it is an inter-sate or intra-state issue before executing the warrant.

Otherwise known as the 10th amendment ; State's Rights.

Knowledge of the Constitution should be a requirement of graduating High School. It is viewed as dangerous by most regulators in today's society; as verified by some of Clinton comments made in public in the past.....

Charles,

You may want to inform RF Products, Mirage, TE Systems, TPL and all of the manufacturers of VHF amps. Include Radio Shack, Ramsey, and the list is too long to continue.

Every amp I ever used for 2m, 70cm, 1 1/4m or 6m had RF sensed keying. I used them for AMSAT / OSCAR, Shuttle voice, shuttle packet, weak signal, meteor scatter, every mode of emission I chose to pursue.

It was a type of AM called CW. :-) Tune from 28.0MHz to 28.3MHz and
you will hear all sorts of amateur low power CW beacons from all
over the US and beyond. Others use 5-10 watts SSB and beam antennas
to talk all over the world when the band is open, usually early morning.

Not to mention it is supposed to come under the heading of "commerce"
as in commercial. I fail to see how *amateur* radio signals fall under
the heading of commerce at all.

File a report with internal affairs. They'll investigate and let you know what they find out. [there not going to tell you names, etc] - talk to a lawyer to find out what your options are, etc. I hope your made of money, because you'll need it. Then again call your local TV station, let internal affairs handle it and save yourself a lot of trouble, time, & money.

Wellllllllll, you don't see how a right is being violated? Hell, a DUI checkpoint (and I don't drink) I feel is infringing on my right. But, even if I feel my opinion is wrong, the fact that speeding and DUI checkpoints are utilized as a PREMISE to search or look for other violations, such is the case with "profiling", is certainly a trampling of rights and a travesty of justice. Ok. You seem to hold merit in your view. You say not much can surprise you. Then you can see where this could lead. As an inducement, as is with traffic cases involving narcotics and/or contraband, the initial arresting precinct sometimes share in the bounty (read:legally stolen cash, property, and vehicles) gained through forfeiture acts. You cannot possibly foresee a time in the not-so-distant-future where an officer may go after a vehicle SIMPLY because of the antenna(s)? They confiscate cars and trucks (even if they are pieces of shit) for a minute quantity of drugs. What makes you think they won't have an inducement for hundreds, even thousands of dollars worth of radio equipment? Don't know what part of the country you are in, but down here in the southland, cop pulls you over and you are alone, ain't a damn thing you can do. Ask for a video camera or superior officer in some of these back water towns? Ha! That will probably get you to the hospital and then jail, courtesy of Caleb and Jeb, who just happen to be the nephews of the judge y'all are going to go in front of. Better be a rich, high powered man! We need no more intrusions.

The same thing that probably cause is right now. It's defined in law. It's the belief of a reasonable person that a crime has been or will be committed. IE: A cop clocks you doing 90 in a 50 - a crime has been commited; You are driving around a warehouse at 3am with the lights off on your car, driving slowly, wearing dark clothes (you might be getting ready to break in...)...

6995. SWR Question

Newsgroup: rec.radio.cb
Date: 2000-09-27 01:51:38 UTC
From: kschroed@columbus.rr.com
Message-ID: <39d151a6.37581176@news-server>
Source record: 53414

I am trying out two handheld cb's for the car, a midland 75-822 with car kit and a radio shack trc-234. I know both won't get the reception of a mobile, but I especially like the midland for it's size and ease of taking it in and out of the car.

I bought a $40 radio shack antenna, I wanted immediate gratification and there are no good antenna stores around. I then bought an SWR meter and have been trying to tune the damn antenna.

I get better swr on channel 1 than channel 40. Everyone tells me this means the antenna is too long. Okay, I hack off an inch. I am still way in the red. To make a long story short I have probably cut off 4 inches of antenna and I am still at 2.5 or so on channel 19. The cable seems okay, the numbers do get better the shorter I make it, but is this too much antenna cut off? Both radios have high swr. Is this the best I shoud expect or shoudl I cut off more? Is it a limitation of the radios, or antenna? Or should I throw the antenna away and buy a Wilson 1000?

Any opinions appreciated.

OK, then...
You say "CB radios are hardly what I'd consider 'long distance'"
I say "Get rid of those foot warmers boys!"
Somehow I believe you're saying, in your statement, that CB radio isn't for long distance communication. With that, I agree by stating people shouldn't run illegal amps on their rigs. Therefore, I also too concur with your thought that CB radio isn't for long distance communication.

Yes?

The govt does two things very well.
1. They take our money.
2. They take away our freedoms.

This will never change with the demopublican party. Gush
and Bore are both Socalist. As others have said, we can stop
this shit if we vote for the Libertarian party. Me?
I'M voting for Harry Browne.

I always set mine at about 3 and hold 'em about 2" away. I don't use M6B's for power, but fidelity.

I would say you hacked off too much. You should trim about 1/8" each time... a new CB antenna used on channels 1 - 40 shouldn't require ANY tuning. Go get a Wilson. It'll be worth it.

Actually, if you are stopped, a cop can search your whole passenger compartment
without your permission as long as there's probable cause for the stop. So
unless your radio is in your trunk, you're not safe...

>> No real technical ability needed to enforce this, Bill. A linear is a linear, which a CB'er is not supposed to have hooked up. Stop a CB'er. See a linear being used by that CB'er. Write a ticket. No great technical ability needed there.<<

i use my 10 meter radio and amp for practice for my code .

they cannot prove me wrong . and if i remeber right thats legal

having a amp last time i checked was not illegal , neither is repairing them . using them .

a cop does not have the equipment to triangulate your location . figure out that freq your using and measure your field strength .

most of what all of you are jabbering about isn't even in the bill . your panties are getting all bunched up for no reason .

>>>So would that mean "routine" searches of trucks at state weigh stations by DMV for amps, modded rigs, and such? Or would there have to be probable cause--a suspicion that this driver has used his radio illegal-ly? How in the world would DMV determine that? Would they, upon find-ing an amp in the truck, "presume" he has used it and charge him for it? How? Still seems unworkable to me.

Jerry<<<

exactally my point . also as a bill is going through the motions of becomeing a law , it can and does get changed alot . so the final law could be 100% different than the original bill .

Body handling: HTML body converted to readable text

<< you all are missing a big part of this bill , it targets comercial vehicals .not private vehicals . and there are terms and conditions for searching . read the entire bill again pay close attention to part 7 >>

Part 7 does not say that the bill targets commercial vehicles. Part 7 merely mentions commercial vehicles.

<>

Whether or not to conduct routine searches at truck stops would be up to the individual localities. Part 7 talks about probable cause and how it applies to commercial vehicles in this situation. The bill also mentions training, guidelines, appeals, and who has the final say in any dispute (the FCC).

<>

Let's say there is a CB sitting on the truckers seat with an amp hooked up to it. What would be your guess as to if the amp is being used on CB or not?

<>

Oh brother. If something is against the law and you know it is against the law but you do it anyway and you get caught, then at least own up to it like a man instead of inventing weaselly schoolboy excuses and absurd technicalities.

<< Bunk. The average local cop has NO such knowledge.
I don't mean that to demean the local cop, but
rather to just make a statement of fact.

Do you think a Linear being used for CB
is labelled "illegal CB linear?" On what
basis does a cop know the difference between
CBs, hamradios, etc? The answer in almost
every case is that they don't. The linear
doesn't even need to be "visible" in any
case. The "linear" could be in the trunk
of a vehicle...in one's home and no cop
gets to see it then unless a search warrant
is obtained.

Even assuming this law went through, do you
think those that violate the law now will
just keep their linear in plain sight?

> > 2. IF this goes forward, can other services

> enforcement of those other services - therefore no need for a change in
> the enforcement rules when it comes to those other services.

Easy to say now. FRS, MURS is too new to
have the problems CB has now. Regardless,
this is just the camel's nose under the tent.
Accept this and who knows what will follow
to the detriment of both hams and non-hams.

> > And you can absolutely be certain that
> > if this does go forward that it will be
> > harassment to other services.
>
> Oh, I don't think so, Bill. Thats why we have a license in the back
> pocket, and why the FCC went out of its way to specifically mention that
> licensed services are exempt.

Sorry, I just don't have any faith
in local law enforcement dealing with
this issue...be it CB or any other
service.

Additionally, the law enforcement community probably has little iterest in being the enforcer of CB. The problem comes when some local decides to go on a crusade.

Bottom line, we don't need this at all.

Cheers,
Bill K2UNK >>

Again, go research the background of this bill and see why it has resurfaced. You will find that the sponsors constituents were and are being plagued by CB interference and RFI. In some localities (some, not all) this is a real problem. The FCC simply can't handle CB interference complaints anymore. And it's clear that someone has to, because the CB community isn't going to police itself.

You're right that the local cop probably has no knowledge of what an illegal rig is or isn't. Not right now. But under this bill, he would. The bill states that Local Law Enforcement will get federal guidelines to follow, plus aid and training in helping them to determine what's illegal and what's not. The idea that local cops don't have the brains to understand communications gear is a myth. Training in many kinds of specialties is being administered continually in local departments. This would be no different than a radar course or CPR.

Also remember that if this bill passes, it doesn't mean a bloodbath will suddenly ensue on the local airwaves of every community in the USA. It will be up to local LEOs to decide how and howe much to enforce the regs - based on if illegal activity is causing problems to citizens in their locality. Murder cases will probably not be sidetracked in favor of going after CB violations either.

Bottom line, the era of big goverment is over and thge FCC will probably never again have the manpower necessary to enforce its rules. It's up to the localities now.

Most CBers respect their neighbors and make an effort to keep the peace and keep RFI to a minimum. But a sizeable bunch does not care - and has gotten completely out of hand. Some localities sorely need this bill. Don't deny them its benefit.

This is all well and good, once entry into your home has been made or your car pulled over. I carry my Ham License as required with me in my wallet. I also maintain the record of test completion and current license info in my home records. I can produce these documents if asked for them. In the meantime, what about the intrusion, the traffic stop, the rubber neckers and the possibility of a LEO dead set that he is right because he has the authority to be right.? If you enjoy these assaults on your freedom because they give you the chance to whip out the ole license, I am happy for you. My own form of personal gratification is a little more complex than that, and relies greatly on the proper balance of rights and protection of those rights. Somehow, I don't get a great bit of comfort from having a valid ham ticket in this situation.

If you think this precedent will stop at this point, your life will be full of surprises; and I don't think they will all be pleasant. I am trying to take a realistic look at the measure and it's ramifications. I left the "who has the bigger one" mentality back in the sandbox years ago. Passing my exams for my license didn't exempt me from the human race, or reality.

That was kinda lame 22.

Neomorpheous, are you using a magnet mount? I had the same problem with my Honda Prelude. I replaced my magnet mount with a Wilson 1000 trunk mount and the problem went away. I think the difference in the two are the grounds. Connect a wire between the negative side of the battery and ground at or near the antenna. If you hear a difference that is better than what had before they improve the ground at the antenna. DO NOT KEY THE MIKE WHILE DOING THIS TEST! SERIOUS RF BURNS MAY BE THE RESULT.

> of their duties....

A CB'er without an amateur license is not supposed to be using any amateur radio equipment at all. Therefore, any amateur equipment use by an unlicensed CB'er is subject to enforcement (there is no need to tune the radio, or anything else).

As far as the amateur operator using amateur equipment in the CB band, the officer's authority ends once that amateur license is flashed. It is the FCC's job to deal with the amateur operator at that point.

Once that amateur radio license is flashed, the police officer's
authority ends - the FCC is responsible for enforcement of amateur radio
(including operation outside of authorized frequancies).

Phil, lets not get silly about this. It does not take a thorough understanding of radio, or it nuances, to enforce the great majority of rules concerning CB radio. A CB radio is supposed to have type-acceptance disclosure right on the radio. Without that, it is an radio device not authorized for use in the CB frequencies, and subject to enforcement.

A linear, also without type-acceptance disclosure, is also fairly easy to spot - there are very few things in a home, or vehicle, that looks like a linear (especially few things that are hooked to a transceiver).

As far as TVI (etc.) complaints, or for that matter any other aspect of this proposed rule, I have a strong feeling that most police officers will simply write a report and walk away unless there is some obvious violation (an illegal radio, a linear, etc). That is what they are trained to do in situations where no clear violations exist.

No wonder the Bill of Rights is so weak today - people attempt to interpret it, and the laws as they relate to it, in any way that benefits themselves (no matter how trivial, or how strange the interpretation).

Read the Bill of Rights, Cecil. And then read the FCC rules concerning CB radio. I think you will see that the rules are clearly written to comply fully with the Bill of Rights, and any other laws of this country.

The proposed legislation only gives local, and state, police officers the authority to inforce those very same FCC regulations. No other authority is offered or granted. Therefore, enforcement of those FCC regulations by local, and state, police officers would also fully comply with the Bill of Rights, and any other laws of this country.

If you don't agree with that, then I suggest that you gather up all your CB buddies and rush out to change those laws. However, don't count on my support - I agree with the laws in question (including the proposed one).

Sorry, my friend, but that has already been challenged, and answered several times by the government. If you want to know the justification behind the federal government's role in radio regulation, I suggest you take it up with the FCC. It is neither my intent, or my desire, to get into an irrelevant discussion in this newsgroup about the FCC as it relates to the Bill Of Rights.

Nonsense, a linear is a radio device and it is a fact that the federal government has authority to regulate all aspects of radio in this country. That authority to regulate radio has been challenged, and answered by the goverment, several times. If you don't agree with that authority, then I suggest that you take it up with the FCC.

David, read the FCC rules concerning CB radio. There is nothing in those rules that would allow for unwarranted seach and seizure, or assumed guilt. The proposed legislation anly allows for local enforcement of those very same rules, so there is nothing there that would allow for unwarranted seach and seizure, or assumed guilt, either.

> How are hams being protected? Please

The proposed legislation specifically excludes enforcement, by local law enforcement, of any licensed radio service.

By the way, the rest of your comments are so long-winded, and so wide-reaching, I simply don't have the energy, time, or desire, to respond. I'll get back to you when I'm ready to write a book.

The rules relating to ham radio will continue to be enforced by the FCC, including those rules concerning use outside of authorized frequencies. So, before you consider that option, I strongly suggest you check out the FCC's enforcement efforts concerning amateur radio (including the heavy fines, loss of privileges, and so forth).

> are the police going to handle them?

Consider this also. The bill (HR2346) is probably NOT intended
to open the door to motor vehicle CB violations as much as it
is at people running CB illegal power that causes local
interference. No one much cares that an 18 wheeler happens to
roll through an area using illegal power on channel 19. The
problem that the feds are trying to address is the persistent
LOCAL violator that has a local history of interference.

That being said, just how do the locals ever get to see
that illegal station set-up UBLESS they first get a search
warrant? Now, if you are with me so far, you should be
able to see that it can be a very easy situation that
arises where some neighbor of a ham complains about that
ham neighbor "always operating his CB and interfering with
my TV". The cops don't have to notify the ham at all. The
local cops can get a search warrant even though the
operation doesn't involve any CB use at all.

If you don't think that is a possibility, then you
are truly naive.

Remember, this proposed law does NOT exempt anyone
from scrutiny (i.e. a ham license doesn't exempt
anyone from having the police search their home
to look for illegal CB equipment, use or operation.)

Cheers,
Bill K2UNK

ROTFLMAO

What do you think, a ham license is a shield against
being investigated for illegal CB activity. That is
NOT what the law states. The law in no way restricts
the local police from investigating illegal CB
oeration by anyone, includinga licensed ham.

Let's look at a scenario: A licensed ham
is using his IC-706 on CB running 100 watts.
Someone (maybe another CB person) reports to
the local police that Mr. Smith is illegally running
high power on CB channels.

The local police investigate (and for arguments
sake, lets agree that these local police really
know something about CB, radio, spectrum
analysers, DF equipment, etc.

The local police investigate and determine that
Mr. Smith is truly operating high power from
his residence on one or more CB channels.
The local police get a search warrant and confront
Mr. Smith at his home. Mr. Smith advises
the local police that he is a ham and shows
the local police his ham license and then
tells them they (the local police) they have
no jrisdiction to look at any of his ham equipment.

Just what do you think the local police will
do next?

Cheers,
Bill K2UNK

And I fully agree with you Phil. Those
that seem to think this bill acknowledge
or exempts hams from any investigation by
locals are fooling themselves. The law,
as perhaps you can better explain, does
not EXEMPT hams from scrutiny at all.

Indeed, those that believe the law exempts
anyone from scrutiny just because they have
some other licensed service onboard (vehicle
or fixed location) are truly ignorant (IMHO).

The fact that the law calls for the FCC to
assist/train localpolice is even more pathetic
as the cost of such assistance would likly
exceed the cost of directly funding the FCC
to do the job right themselves.

Is every local law agency going to suddenly
have someone trained as a CB violations expert?
Not likly at all from my contact with the
needs of local police. Will some local
police end up using this new authority
in abusive fashion...you bet.

Cheers,
Bill K2UNK

Additionally, as follow-up to Phil's comment,
at some point any enforcement MUST or will end
up in court. Once in court the local cop can't
just say he had an illegal linear for CB. The
local cop will be cross examined as to his
credentials regarding his knowledge as an
expert in that area. No expertise, no
conviction.

> >...Thats why we have a license in the back pocket,
> >and why the FCC went out of its way to specifically mention that

> The ARRL, not the FCC, got that amendment put in.

And the law does NOT exempt hams from scrutiny
at all. Consider the following three scenarios
in which all three people are licensed hams:

1 - Mr. Jones no longer has any ham equipment
as he likes to operate CB with an illegal linear
from his home.

2. Mr. Jones has both ham equipment (including
a 10m linear) and CB equipment. Mr. Jones
occasionally uses the 10m linear with his
CB rig from his home.

3. Mr. Jones has a ham transciever which he
also uses to run illegal power on CB channels.

In each of the above cases, let's agree that
the police have DFed Mr. Jones illegal CB
activity to his home and are now investigating

him and his home via a search warrant.

Now anyone that thinks the mere holding of a valid ham license will EXEMPT a ham from being investigater for illegal CB operation is fooling themselves. The law only exempts hams from local investigation of amateur service violations...NOT exclusively from any/all violations (i.e. including illegal CB operations).

Cheers,
Bill K2UNK

Take a look at most of the audio amplifyers these
days. They all look like linears.

> as far as TVI (etc.) complaints, or for that matter any other aspect

The ONLY reason this law is proposed is to give
local law enforcement the power to investigate
and go after interference complaints that are
believed to originate from illegal CB activity.
Research the history of the bill and that is
perfectly clear. The ONLY probable trigger
to local law enforcement activity will be
complaint(s) of interference, NOT simple
visual enforcement at motor vehicle stops.

Sorry. Should have said, An amp for HF can't have an RF sensing circuit,
used to key it.

It is NOT a low opinion of cops. It is
the reality that the cops have NO true
expertise in this area of law to begin
with. It isn't simply knowling what a
CB radio looks like.

<SNIP of all the comments about people seeing
CB radios in various contexts>

> And a good chuck of those people know that no metal box is normally
> hooked to a CB radio. So, unless that box says "power supply," it
> fairly well narrows down what that box is.

So now we expect the cop to not only see a CB
radio, but to then examine the wiring to and
from that radio? Get real. Such an exam
of a person's vehicle and the wiring therein
go well beyond the realm of a traffic stop.

Additionally, why you assume that a linear is necessarily
in plain sight makes no sense at all. Also,
the typical in-car strereo high power amps
look very much like a radio linear.

> And, you seem to forget that the bill specifically states that the FCC
> will give guidence concerning the enforcement of this. I'm sure that at
> least part of that guidence will include a sufficient description of a linear.

It may say that, but without the funding
dollars to do so it is just empty words.
The legislators would get more enforcement if
they just funded the enforcement side of
the FCC for CB violations.

> > [snip] The linear doesn't even need to be

It is not the "run-of-the-mill" stuff that
the law is intended to go after. You need to
research the background of this law.

> > Sorry, I just don't have any faith

I see the prospect of abuse...how widespread such
abuse may be is not something I have predicted.
We obviously disagree.

Enforcemnt of federal radio laws, for any
service, should be by the FCC...NOT by local
police who have neither the time nor expertise
to do so.

Cheers,

Not to mention the location of the amp. My SGC-500 amp is in my
toolbox in the rear of my pickup. A cop could do a complete search
of the cab of my pickup and never find it. I'm sure there are even
better places to hide an amp on an 18-wheeler.

That's really funny, Dwight, considering that all powers not expressly enumerated as granted to the federal government are prohibited to the federal government. Where in the Constitution does it give the feds power and authority over amateur radio emissions? They certainly are NOT "commerce"?

> I agree with the laws in question (including the proposed one).

You seem to agree with all laws that push this once free country down the road toward fascism. Be careful what you wish for.

That's Bull$hit, Dwight. The Constitution expressly prohibits the
federal government from having any power or authority except as
expressly granted in the Constitution. Exactly where in the
Constitution does it mention CB radio?

That's true, Dwight, but that authority does NOT come from the
Constitution. That authority is, in fact, in violation of the
letter of the Constitution. It happens every time the fox is
left in charge of the henhouse. Exactly the same thing was
true in Nazi Germany.

And, like I have already said, the FCC rules are fully written to conply with the Bill of Rights and the other laws of this country. If you don't agree with that, then I suggest you take it up with the FCC. I have already said that I have no desire to discuss constitutional law. Besides, again like I have already said, the issues you raise have been addressed many times before, and the end result simply does not agree with your opinion.

Well chuckie if your lawyer told you that he is a bigger fool then you are and don't no his ass from a hole in the ground .

the facts are this and clear and the go like this

avoid Disseminating any info about anyone that can even remotely be considered private.Do not repeat unconfirmed gossip or trade gossip,,especially about the financial condition of a competitor, business. or product. talk to a lawyer to protect your right's again people dont listen to chuckie he dont no his ass from a hole in the ground either..
and if you think lawyers dont take cases like this come to the 23rd dist. courd on oct.15 at 9am for this case, chuck and bring your so called lawyer, he might learn a thing or to also.

but i will tell you this little secret chuck knowing what to say and not what to say is my little secret, and if you think im going to tell you your out of your mind. go and find a good lawyer chuck and maybe you will get the facts to.

but dont think your of the hook chuckie , and like you said you better get out of here and stop jumping on everyones ass. so you see chuckie you just think you no all about when in fact you don't no shit . if you think about it chuck thats why im in business and you are not ,and i
i will allways be in business......

have a good day chuckie and i will pray for you .

7048. Re: Upstate NY Police stormtrooping on Long Island

Newsgroup: rec.radio.cb
Date: 2000-09-28 00:00:00 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <39D361B4.63EC@bellsouth.net>
Source record: 53576

If I am innocent, have committed no crime, am not drunk, they jerk me out of my car, tear up the upholstery/carpet, and ruin my personal belongings, I may not win, but I will <try> to sue the hell out of the SOBS! I am a law-abiding citizen who has never been arrested--haven't even had a traffic ticket in 20 years. For the power hungry misfits who have no business being a cop in the first place who would be the ones to do such a thing because they <can>, for them to be able to get away with it is a travesty. Abuse of police power must not be tolerated!

I know many cops on my local city/county force. Most of them are just nice, hometown folks trying to make a living. My ex-brother-in-law is a Sergeant, and he once pulled me over for a joke. After scaring the dickens out of me, he came up to the car and said, "I just wanted to say 'hello'"! We both had a laugh over it, and I said, "That's OK, I'll get 'even' with you for that!". Later I put a rubber snake where he'd find it and scared the crap outta him! Most cops are nice people, but the profession attracts many people who somehow manage to fake their way past the psycological tests. The badge and the gun goes to their heads, and they become of the SS stormtrooper mentality. These are the ones who abuse innocent people and even those guilty of traffic offenses Did everyone see the video of the South Carolina trooper who dragged a frightened woman out of her car on the interstate screaming obscenities at her? (SC is where they invented the phrase "Yo' in a heap 'o trouble, boy, yuh heah me?") THAT is what I fear from cops because you never know what kind's gonna stop you. I got stopped by a smart-ass trooper when I wasn't speeding (mistaken identity). He got mad at ME because I wasn't the one! No ticket, but a lot of smart mouth.

TMR,

Exactly! Everyone who is opposed to this needs to contact their
Congressmen and express their opposition to this. I know they are
going to do SOMETHING, but this is a bad precedent and needs to be
quashed. If anything, the funding taken from FCC needs to be restored
so that the people TRAINED for this can do the job they were created
for.

Cecil,

They are not supposed to be able to. If the guy has a license, it would be turned over to FCC for action. But I don't foresee this happening. There would be much confusion and many mistaken cases of unauthorized hassling of licensed hams.

beaker,

I get the feeling that some of the holier-than-thou hams are suffering
from the "NaNaNaNa Boo Boo" syndrome. These guys are the ones who want
to be able to sit back and say, "You CBers gonna get yours, BLAH BLAH"!
What they don't see is that this is going to create a mess for CBers
AND hams alike. I consider it an intolerable opportunity for abuse of
innocent people by fat Bubba sheriffs who wouldn't know a CB from a cell
phone. I'm already contacting my own Congressman as well as Mr.
Feingold to express vehement opposition.

Dwight Stewart , i think they should crack down on hams even harder than cb's , some of the ham operators i know , are breaking many more laws than any cb'er . one , when hearing a radio station in a females car , will tune is hughly modified kenwood to the station they have on and will start talking to them over there radio .

since hams agree to alot more rules and regulations , hams should be held more accountable than all others .

why are hams the ones barking the loudest about this law ? maby cause it takes the spot light off them .

every one of you hams that put more freq's in your expensive yeasu or kenwood are much more responcable for you actions then a cb'er with a modified 10 meter rig . cause your trained and licenced .

you guys need to look at your selves before condemming us cb'ers

On a commercial flight, I'd say no. Ask the captain. On a
private aircraft, it's up to the pilot. If your the pilot, and
if the CB doesn't interfere with flight aids, sure, why not.

You mean to say that it's not part of the requirement of study in a high-school "American History" course? It was when I went to school - and the American history class was mandatory.

Although the FCC can have its authority "delegated" to the states ("withdrawing the reservation of authority"), I believe that most agree that 1) Without training [which will never happen] of local law enforcement, this is a bad idea, and 2) Radio communications (of any type) are of a physical nature which crosses state lines, and to change enforcement duties regarding any sort of interstate commerce may require a Constitutional amendment.... Passing a federal law is not sufficient.

why are hams barking the loudest about the stupid bill ?

i could care less about it . thats one more law that everybody will ignore . i highly doubt that the FINISHED law about state and local police inforceing CB regulations will resemle the origional bill . if the damn thing even pass's .

let the law pass , hell i hope the add a line in the bill allowing cops to inforce HAM regulations too .

what piss's the ham's off is the if a non-ham like me gets caught with illegal equipment , more than likely it will just be seized .
but if a HAM operator gets caught he will loose both his equipment , and his licence . and i am sure a loosing a yeasu would be alot worse than losing a galaxy .

the way this law it written it does not shield them from loosing everything , and that bothers them .

i hope the law pass's .

For those who don't know the reference: 42 USC 1983 - A statute authorizing a
federal tort for damages to civil rights based on a policy, custom, or usage of
a government agency - usually brought about by a failure of the agency to
properly train its personnel on the relevant law, rule, or regulation.

We could always bring back CB licensing, and with ULS, Cores, or whatever the FCC will migrate to, there won't be the administrative overhead that existed back in the 1970's especially considering the use of the Internet today. Maybe that won't stop the amplifier use problem in itself, but it will [or should] return personal responsibility to the service.

Then we should ask Richard Burton, a former amateur operator who has now gone to prison 4 times for transmitting on amateur frequencies since the loss of his license, about the resulting enforcement. ;-)

You would hope so. My point is that a local officer is not likely to receive sufficient training to know that's where his authority should stop (let alone training to properly enforce such a law), or we may end up with one who doesn't care.....

I've had the opportunity to investigate corruption of several [state and local] peace officers during my federal career. You'll be amazed at what some cops don't know about the law (including laws that they're supposed to enforce).

To an untrained officer, a black square box containing a power supply looks
very much like a black square box containing a linear. Both are hooked to a
transceiver in what would appear to be a similar manner.

What do you suppose happens when you get a overzealous police officer who
doesn't wish to relinquish his "authority?" Or, a local police officer who
believes he has the authority to confiscate and prosecute...regardless of the
amateur exemption? This happens all the time with regard to mobile scanner
laws. What makes you think this will be handled any differently?

This is absolutely false! As a licensed ham, you should know this better than
anyone.

NO LICENSE WHATSOEVER is required to possess or use ANY amateur radio
transceiver. A license of proper class is only required to TRANSMIT with said
transceiver. Mere possession of the radio is NOT sufficient grounds to warrant
action against the owner. There MUST be sufficient evidence that the radio has
been used to transmit illegally.

>conviction.

Even if there is no conviction, the innocent party has still incurred the costs of coming to court, taking time off of work, attorneys fees, and possible loss in value of equipment due to damage while in police custody.

Are there provisions to address this in the bill? The recoupment of costs suffered by LEGAL radio operators who will become the targets of police scrutiny and overzealous enforcement efforts as a result of this bill?

> power and authority over amateur radio emissions? They certainly are
> NOT "commerce"?

Then why is the FCC a bureau of the Commerce Department? Radio is in fact used to transport information across state lines, which aids and supports commerce (to the extent that such a message itself isn't commerce - think of the telegraph and telegrams of the 1800's). Just because CB and amateur radio do not have business content doesn't mean that personal content cannot be commerce. Your telephone at work IS used in commerce (or industry), but how about your home telephone? Although the rates may be different, it's still subject to the same basic government oversight.

> > I agree with the laws in question (including the proposed one).
>
> You seem to agree with all laws that push this once free country
> down the road toward fascism. Be careful what you wish for.

...And that is already happening. Example: California's gun registration laws for certain firearms are merely a prelude to confiscation (which leads to a LOSS of a Constitutional check-and-balance behind the Second Amendment). You don't have to believe me - ask the Australians. Ask the Germans, circa 1936. Under the U.S. Constitution, the People have the ability to exercise TWO powers over their government: Election and revolution. Remove revolution, and there will be no check when the government removes election .... then, what do we have? Well, we certainly won't have a democracy!

...And as I have said in another RRA newsgroup (see "eBay and the sale of linears" or whatever it was), POSSESSION is not an illegal act. USE is the illegal act.

[Granted that the regulation does state that possession implies a presumption of use, a presumption is not an equation, but merely a strong implication, which must be considered with any other evidence.]

Sorry, Phil - didn't mean to get your panties in a bunch.

Has nothing to do with being a communications lawyer - has to do with a common sense interpretation of the Constitution.

The Supremes have been wrong before - in the Dred Scott case, they ruled that negroes were not 'persons' as referred to in the Constitution. Their reasoning was explicitly that if they were 'persons', they would have to be allowed the right to own any damn firearm they wanted, as per the 2nd.

Sorry, the 10th ensures that the feds have no jurisdiction over intra-state communications, no matter what the legal profession says.

We've gotten so durn deeply buried in statute law, that common law has been cast aside. This is fundamentally wrong.

Just out of curiosity, how many of the cases you referred to were heard by the Supremes, and upheld on Constitutional grounds? (I'm genuinely interested) FCC v. Brown? Was the defense made upon Constitutional grounds?

Joe

Yeah, we had an example of that here locally. Had a bootlegger on 2 meters. He had previously had a license and call, but it was no longer current. When contacted, he admitted not having a license and had no intention of getting one, but would use the repeater whenever he choose to do so.

When the ARRL was asked to help (They are the first step of enforcement for amateur radio) their reply was they could not assist due to the contact made with the bootlegger was a violation. They seemed perfectly happy to leave it at that. He is still active, and has been asked off of repeaters in a 50 mile radius, but refuses to comply......

The FCC will fine an amateur radio operator on occasion, but that is usually after a litany of preliminary steps are taken by the various levels of representatives acting in behalf of the ARRL. The FCC is seldom the first one to contact an Amateur operator in violation of rules unless his actions endanger lives....

Dwight, what part of "Deregulated" don't you understand? The search and
seizure is only justified when a violation occurs. The learning curve
needed to get the skill to determine a violation versus legal operation will
verify this concern.

i agree. i watch for the laws all the time anyway and if you want to
key it up , you just have to be more careful and watch for the blue
meanies. heck most people who live around here know that already. i
guess i will actually become somewhat of a radio outlaw, for what it is
worth, ...cd is out.........

Yes, that makes sense, apart from surges, never had one that I knew about.
Must be that I have stable mains ??????

> (4) Apply the same treatment to the video monitor ... beware of high
> voltages if you go inside!!!!

Being a simple G6, what is a high voltage? ;-) I take it from that
comment that the treatment should be as close to the problem as can be.
Noted

The Galaxy 949 and 959 are not the leaders anymore. RCI has used new
technology to create the all new Texas Ranger 900 series. These are the
best CB radios in the world. I will personally stand behind that statement.
RCI needed a basic CB line, so they bought out Texas Ranger. These units
are actually using the same technology that the Ranger 6300 uses. I have
used and tested hundreds of different kinds of CB radios. This is without a
doubt, the best line of 40 channel CB's I have ever had the opportunity of
using. These radios all come with a 2 year warranty which we will honor.
I have to agree with Bassman on the Wilson 5000 magnet mount, though. This
is the antenna I use and I really do not have any complaints. You can check
out these sites.

I have had only 1 webpage in the last 3 years. It's only been at one
URL. If you can't provide that URL for the group, that simply proves
you are talking out of your ass, and you have never been on my page.

At any rate, as I said before... just because you and your buttbuddies
are queer, doesn't mean the rest of the world is, so shut your
cock-holdster, and quit trying to push your personal life off on me. I
don't want it.

Both are good antennas, I've used both for YEARS! If your looking for real quality, spend a few bucks more and get a Wilson 5000. Look at cut-away views on the wilson web site or at a cb shop wilson display. You'll see the quality for yourself. Mr David is right.

On a clear night I could transmit from my base station in Hinsdale to
Friendship (about 20 miles). I'd say it's quite long of a distance
for a radio service that should only be able to communicate with other
stations within, as you said, 5 miles. Back to that foot-warmer
remark - I'm talking about stations that actually say they're in, for
instance, Alabama and I'm in New York, barring the occasional
atmospheric phoneme. That, although cool from a technological point
of view, is annoying.

Thanks for the reply Chas. I was all set to go with the President Jackson when another person responed to my post saying they changed the "audio chain" (whatever that is, and as though was a bad thing to be changed) in the Presidents and they wont take a power mike. I am going to call Express Electronics tomorrow and ask about that, since I am still inclined towards the presidents since I have heard so many good things about them.

Doc,

I've seen many of your posts and you seem very knowlegable. Before I make a suggestion, let me run it past you. Suppose the antenna were to have a bad - VERY bad - ground connection. With the 'ground' largely existing at the HT as part of the power feed into it, would this make the antenna appear 'very long'? Should he check the grounding on the thing?

Thanks & 73s from Rochester, NY
Jim

Tut, tut! It's a bit frustrating when the CPU runs at a higher frequency than your TX?!?!

As you've noticed, PCs are noisier than a toddler's birthday party. But ferrites on the leads, decent grounding and (computer engineers look away now 'cos you're not gonna understand this) making sure that all the metalwork - like the drive cage - is really connected to the chassis, should really help. (Sadly, Bill Gates will still exist, however)

Max.

Well i saw your picture on your web page and just made a educated guess about your sexuality... But on a lighter side i didnt say anything you said personaly was wrong you took it that way, i wasnt even commenting on what you said in your post, i understand alot of people use lamp cord for hooking up amplifiers Where did I jump down your throat ? Please point out in my post where i jumped down your throat, why do i need congeniality classes you are the one who told me to pull my head out of my ass i never attacked what you said or you personaly. It is unfortunate to hear that you have a frail personality and take some one disagreeing with you as being a sneid remark but frankly i don't see it in my post Sorry if your feelings are easily hurt..

i agree on using .1 capacitor but more than 1 will probably be needed , try using one from the positive side of fan wire to ground and another from the ground side wire to chassis ground then try 1 across the positive wire and the wire and they should be placed as close to the fan motor as possible , if this amount doesnt work try doubling up on them negative connection

>Hot damn, get that over powered, over modulated & totally distorted crap off
>the air waves!!!

Agreed, but it's not the locals or state;'s function -- it's
the FCC's function. This Bill is nothing more than a cop-out
by The Congress (specifically Senator Feingold of Wisconsin) for
non-technically-qualified "locals" to do the FCC's job - more
sickening after the self-same Congress cut the FCC;s budget so
that it couldn't do its job properly.

Replace it with a Bill authorizing the necessary manpower,
equipment, and operating budget for the technixally-qualified
FCC's Field Enforcement folks to do their job properly.

I'm waiting for the first innocent operator to get nailed by
some hot-dog local cop who doesn't know (or care to know) the
differemce between a linear amplifier and a toaster-oven ....
I'll defend that person at cost.

hehe funny man When was the last time you check on if having an amp is illegal? You can't even spell. Yes you would need a radiotelephone license from the FCC to Legally repair amplifiers Why on gods green earth would you need a amp to practice code You do not practice it over the air.

No it just gives them another reason to pull you over an antenna gives them probable cause to search your vehicle perhaps they find another violation while this is in the process.If that it is not profiling , lets assume they were alerted of a rfi problem in a particular area and they decide one day to stop anyone with an antenna hoping to find the culprit

"Dwight Stewart" <stewartx@sccoast.net> wrote in message >

Ahhh, the more I think about it, the more I think it will be a smokesceen. Delegate enforcement to the locals (wink ,wink) and give the appearance something is being done, after all, the feds know the cops won't do a damn thing, nor do they care, and this will be clearly demonstrated if the bill passes. (But it won't)

7150. Re: HR 2346 STATE & LOCAL COPS TO ENFORCE CB RADIO REGS

You are correct on the Echelon post. It is not just the phone, but ALL modes of communication that are monitored for the "hot" words.

Same as jury nullification. A jury can set anyone free if they feel the law is wrong, but the lawyers are prohibited from bringing it to attention and the court is intentionally quiet on the matter.

Stave Manfield, the ARRL's Washington liaison, and I have
hashed this thing out ad nauseaum. He feels that I am beating
a dead horse with my vociferous opposition because the "amateur
licensee" exemption will protect our interests....which I do not
agree with.

>
> No real technical ability needed to enforce this, Bill.

As someone who spent 30 years "on the street" enforcing radio regulations, my expert opinion is that the average LEO is totally unqualified to enforce this matter (and I spent several years as a street cop before I became an FCC agent).

A good part of those 30 years was spent trying to give the guidance and training called for in the Bill to non-technical rank-and-file LEOs who were trying to keep the peace amongst complaints of TVI and audio rectification - and then unraveling the damage done by said unqualified personnel trying to enforce same without a THOROUGH understanding of radio and its nuances.

If you think that the FCC is going to have the manpower and budget to instruct, monitor, and provide corrective feedback to every Podunk PD in the country, think again.

>A linear is a
>linear, which a CB'er is not supposed to have hooked up. Stop a CB'er.
>See a linear being used by that CB'er. Write a ticket. No great
>technical ability needed there.

Write a ticket for "having a linear" when in fact it isn't a CB linear, or when the zealot says "I don't care what sort of license you have" (gonna' happen a LOT), and it's big-time Sect. 1983 lawsuit against the Department with recovery of punitive damages, costs, and attorney fees.......

>There is no widespread rule violations in those other services, and no
>widespread complaints about interference, so there is no demand for
>enforcement of those other services - therefore no need for a change in
>the enforcement rules when it comes to those other services.

There is no need for any change in "the rules" at all if Senator Feingold would get his colleagues in The Congress to fund the FCC properly, at the level where real enforcement could be done.

>> And you can absolutely be certain that
>> if this does go forward that it will be
>> harassment to other services.

> Oh, I don't think so, Bill. Thats why we have a license in the back
>pocket,

MEANINGLESS

>and why the FCC went out of its way to specifically mention that
>licensed services are exempt.

The ARRL, not the FCC, got that amendment put in.

The FCC has taken a "head in the sand" approach to this bill:
"Well, we do what The Congress says to do and if they want
these others to do our job we won't complain" rather than screaming
"HEY! that's OUR job...."

The former attitude is why good enforcement posture went away
under Reed Hundt, aided and abetted by shortsighted legistatiors
and adminsitrators, all of whom did not understand what that
job was and its value.

Makes me sick.

That was the argument put forth in cases goiing back to 1942,
and the courts have never upheld it. The last case was FCC v
Brown some 20 years ago, followed almost immediately by The
Congress amending Section 301 of the Communications Act upon
direction of the court to specifically assert Federal
jurisdiction over all radio signals emenating from anywhere in
the US, thereby putting an end to the "not over state lines"
arguments.

Sure. It's the beginnings of a fundamental change in the way that radio regulations are enforced in the USA. I would expect this local authority to expand as the need for such 'service' does. The sad part is that without this, much -most- enforcement just won't get done. I'm not so sure that wouldn't be the better option.

Thanks David,

The harness appears to be fine. It is quite thick. When it is happening, the problem seems to occur at any power level (even low power settings) so I do not think it is a current supply problem.

I am wondering if there is some sort of RF feedback causing the output to go unstable.

I contacted the local radio repair shop, and they said they would not even look at it because the radio was modified !! So it looks as though I am on my own.

Richard.

Message-ID: <Hq3B5.47801$4d.7400214@news02.optonline.net>
Source record: 53655

We use CB (channel 30 am) for aircraft to aircraft communications in our club and get very good distance from them using only short antennas and stock Radio Shack radios. It is not uncommon to talk with other fliers 40-50 miles away at just over 1400 feet AGL (providing the skip is not too strong). When the skip cycle is on it's low side of the curve, we will get even better mileage out of our stock radios with 1/4 mile antennas! When we do a long cross country some of us turn the squelch down so we can chat with the ground stations. The cbers on the ground get a real charge out of it. We sometimes get overwhelmed with the response from the people on the ground and have a hard time picking out one station from another!
We are located are on the east coast on New Jersey so if you hear what seems to be a bunch of pilots on channel you can bet that be us! The Buzzards Row and Jersey Shore ultralight clubs...

KA3, that's all well and good, but some of us have severe cases of paranoia. Hell, the hammies are always getting popped for one reason or another. Now that the Feds want your SS# it is just one more reason not to get involved in the big 'ol cluster**** they call ham radio. I have friends that are hammies and they enjoy what they do. Some would rather stay on the fringe where the excitement is. I have already received an email suggesting that the true outaws will have bogus licences, much as the way kids have fake ID's and of course, fake degrees. Think about it, if this comes to pass, and you get pulled over for a radio inspection and you have an illegal radio for cb, ya' wave that worthless piece of paper and chances are a LEO is not going to wait for a relay check from dispatch to verify the validity of such "license" when it is clear that no other law was broken except maybe some "pain-in-the-ass-regulation concerning cb rules that was delegated because the feds have no true interest in enforcing what they created". ......and this was from a Fla. State Patrol Officer. His words, " I'll be damned if I'm gonna babysit the airways for some cber".

Lemme provide one ... or at least the NG equivalent.

Hams have it even better than that Mr. Mushroom, sir. If you're not a Ham and get caught the FCC will, as a minimum, confiscate your whole station; CB, amp, antennas, tower, everything - and may slap a hefty fine on you to boot. OTOH if a Ham gets caught pushing a KW on ch 19 FCC sends him a letter of apparent violation demanding to know why he did that and what he's going to do to make sure it doesn't happen again. If he provides a reasonable answer (It was my kid. I put a lock on my shack door to keep him out.) that's the end of it - unless he continues to get caught violating the rules. Fair? Maybe not, but doesn't it make more sense to be on the priviledged side than getting crapped on and sniveling about it?

As many of you know, there are CB's that can be "reprogrammed" to work on the amateur 10 meter band and back again easily. As a ham, I can legally attach a KW amp to such a rig so long as I only use the amp on the ham band. If I forget to shut off the amp when I switch to CB, and get caught, FCC assumes it was an honest mistake and simply asks me to make sure it doesn't happen again (at least the first time), but if I wasn't a ham they'd confiscate my equipment, worth $100s, and prolly fine me a grand or so. Which would you prefer?

And B4 yawl ask, no; I don't have such a setup ... yet :o)

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 45.00 (US$) INCLUDING shipping from Canada
Great deal ! ! !!
A Picture can be e-mailed.

Have you checked your SWR? Is the radio well venelated? Reason I ask is
most all modern rigs have circuits to protect the output transistors.
Some shut off the transmitter if the SWR or temperature is too high. Be
sure to "wiggle" the coax, et cetera and look for spikes when checking
swr.
Good luck

Try temporarily shorting across that "swing" diode that was added to the resistor (to restore original function). Then see if the problem is still there..........

I once worked for a company named Koala Technologies. We had a guy
in LA build us a fake life-size Koala mascot/logo out of rabbit fur.
He was headed up I-5 in the P.M. to deliver the finished product when
he was arrested by the CHP for stuffing an endangered species and
spent the night in jail.

Check make sure all the wires are plugged into the board ,not by
sight but to actually push down on the plug.Their is one especailly
bad about this towards the right front side of the radio hard to find
it is under a mess of wires,and you might try checking the 2sb754
transsistor and also the pcb board itself might have a crack in it.
hope this helps

Source record: 53671

Yes I have checked the SWR. Worst case it is 1.2~1.3. I "wiggled" the cables etc. and found no problems.

When the problem occurs, the TX output transmits a full tilt "squeal", so I do not think they are being turned off prematurely. I have also tried turning down the output power in case something was overheating, and the problem is still there. The problem is sometimes evident right after switch-on after the radio has been sitting for quite a while unpowered.

Thanks for the suggestions.

Richard.

I may try removing it (or at least disconnecting one end). Shorting across
it may cause problems, as it would then mean I would be shorting across R285
which is in parallel with the diode.

Thanks for the suggestion.

Richard.

Check out these sites, should be what you are looking for.

http://www.barrettcommunications.com.au/
http://www.pentacomstat.com.au/land_service.html

http://www.codan.com.au/radcom/index.html
http://www.motorola.com/LMPS/RNSG/mobiles/micom/micom_2e/index.html
http://www.sgcworld.com/
Those links are to some real professional utility HF radios, a bit on
the spendy side but that goes with the dependability as well as ease
of use. If you want to wing it you could get by with a ham radio that
is modified to work out of band- would be illegal and definately not
as ease to use. An Icom 706 could be a good choice in that direction.
Then you have to worry about an automatically tuned antenna since you
will be all over the HF band depending on area and time of day.
The first two links are right in your back yard with the second one
being some information on land mobile. The codan and barrett systems
really look like the cats meow. The motorola is good like always but a
real pain to work with customer sales. The SGC is okay and is on the
lower price range.
Hope this helps.
-Dave

Not sure what you mean by "bad ground". Not enough capactitance between the antenna and ground plane can cause the antenna to appear to short. This is the case a lot of time when you mount an antenna on a mirror mount or the side of a truck bed.

It doesn't say he's normal Chris. It says (according to him) that he is
not suffering a from a psychiatric illness.
Schizophrenia is also a result of an imbalance of chemicals in the
brain. Most sufferers admit that they have a mental illness.
No bit of paper could ever say that Mouldy is NORMAL. He has an abnormal
brain condition which he readily admits to. His behaviour on this NG has
also furnished us all with proof that he is far from normal.

>>I recently purchased a galaxy 77hml, after speaking with a galaxy tech at galaxy, he told me to open the mod pot all the way. This didnt seem reasonable to me so I have decided to send it to a good tech to have anything and everything I can done to the unit. I do planning on adding a linear very soon.

Who can you suggest? <<<

if you are gonna get a amp soon , do not touch the radio , the few extra watts are not worth it . the over modulation you wil get will just make the amp sound worse . the less you do to a radio the longer it lasts . now i know thats not allways the case , some mod'ed radio last for ever .

but like i said at first , before you get the radio modified , drop the $ you would spend in a better antenna , it will do more for you than a few more watts .

Well, the Constitution itself states that it is to be "the supreme law of the land". Therefore it is the standard. There's the authority. As to common sense, well, it would be hard to read the Federalist Papers, the Anti-Federalist Papers, and other writings by the founding fathers without this becoming abundantly clear.

> >The Supremes have been wrong before -
>
> Yes ... in an Advanced Constitutional Law course a mumber of

> to support a "popular" but clearly wrong action. The prof thought
> that it was brilliant, but the Supremes weren't about to be
> reversed and the law as set forth in that case is still the law.

I agree. The term 'seperation of church and state' does not appear anywhere in the Constitution. In fact, what the first states is that "Congress shall make no law regarding the establishment of religion...". So I named one example (out of many that I could rattle off), and you named another (presumably out of many others that you could rattle off). So we seem to agree that the Supremes no longer follow their Constitutional mandate to ensure legislation adheres to the Constitution, preferring to rather 'interpret' the Constitution, which is a flexible concept at best.

So I state again, the federal gov has no authority over the airwaves. The only possible exception is the frequently abused interstate commerce clause - and that is a drastic stretch. So if the transmissions are being used in interstate commerce, I would have to begrudgingly admit that they may _possibly_ fall under that. However, it is apparent once again that the founding fathers did not mean that all subjects connected to commerce, no

matter how tenuous the link, could fall under this clause. It's pretty obvious, however, that the vast majority of CB and amateur transmissions have nothing to do with any sort of commerce whatsoever.

I'd like to ask once again if any of the cases you referred to regarding FCC authority were tried in front of the Supremes, and argued on Constitutional grounds.

Thanx,
Joe

Just in case you don't know, Charlie, Hollingsworth is the head of the FCC (the agency that is supposed to govern cb) who makes it his mission to bust hammies on a weekly basis. He has a real problem with hammies stepping out of line, but is a closet fan of us cbers, which is why there is no enforcement on 11 meter.

mailme@rizzap.com (pOsTeR bOy) pounded on the keyboard and wrote:

>Does anyone know if it is permissible to operate a CB radio on board
>an aircraft in flight. Flight altitude would not exceed 2500 feet
>above sea level, if that matters.

About 1977 I attacked a small center loaded antenna to the step pad on the left strut of a Cessna 172. I secured the coax with tie wraps up the strut and into the cabin. I connected a small AM CB radio in the cockpit to the cigarette lighter outlet. I was flying out of Patrick AFB, Florida and took of toward Vero Beach, Fl. When I got to around 3000 feet I turned the radio on some channel that I cannot remember. The first thing I remember is that there were tons of people on the channel. When I made a call and stated that I was "airborne" several dozen people tried to come back to me. It was overwhelming. I turned the radio off never tried it again.

Now remember, this was back in the 70s when everyone and his brother had a CB radio. Now it might not be so bad.

Just be careful that you secure the antenna so that it will not come loose in flight.

Cheers

Brian

Wednesday, just out of curiosity, and prompted by this thread, I went down to 28.085. There were truckers, plain as day, on AM just talking away. They were talking about whether they could clear the next over-pass, or where the next truck stop way. That, I heard for myself. So, there IS a problem there. I will be glad to listen and report my find-ings.

Jerry

If the radio you're using on CB is capable of transmitting in the Amateur
bands, or off the regular, channelized CB band, it's illegal for CB use.
Even if you are a HAM. 2950/70s, Galaxy Saturns/2517s/DX-11Bs/2980/90s,
etc, etc, are not legal CB radios for ANYONE.

Your unit is breaking into oscillation. Since this (I believe) is a fairly high power unit... and the audio mods to it... that makes it even more suseptable to oscillations. It could be this "panther???" device's gain is very high and itself is oscillating... or it could be the final amplifier. It could also be a result of a few of the following:
Power supply inadequate or oscillating (not very likely)
Wires from mods too long and picking up RF
Antenna match way off

Try and check some of these things and my feeling is to be suspicious of the mods made. Make sure wires from the mod are short and not draped all over the place. Test the unit into a dummy load only. See if the problems changes... the pitch of the oscillation or intensity. Report back with more info...

Sorry... didn't see it before. No need for name calling...

I never said that... what I did say is that the different classes won't change the potential output power. It's certinly true that given a certain input level into both class C and class A amps won't give you the same gain. The class C amp will require somewhat more power input to acheive the same output as a class A. That's not to say that the class C amp can't put out every bit as much as the class A if the drive is increased.

A much better choice than the TNT for the average consumer.
The TNT is a narrow tuned amp... very unusual... and if it was designed
better... it would be an asskicker of an amp with excellent efficiency.
Unfortunately... it's not very well designed and has a nasty tendany to want
to oscillate. I dialed-in a TNT twelve pak one time and it was awesome. The
mods were extensive and a real pain but it was stable and it wasn't even
getting hot at a 400W level. Try that with any of the broadband amps like
Texas Star, Palomar, Messenger, Galaxy... etc. and that sucker will get red
hot.

7210. CB Gear for Sale (update)

Newsgroup: rec.radio.cb
Date: 2000-09-29 00:00:00 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <8r1i2a$f5i$2@nntp9.atl.mindspring.net>
Source record: 53721

Time to make some room for more new toys and old gear.....

BASE RADIOS:

1..... Browning R27/S23 (SOLD)

2..... Browning MKIII AM/SSB Receiver and AM transmitter with G-Stand D104
$250.00 Plus shipping
In working condition, sounds good on transmit and receive, Some crystals out
of tolerance on Transmitter. Some documentation included

3..... Browning MKIII AM/SSB Receiver and AM/SSB Transmitter w/banana Mic
$250.00 plus shipping
Rig is barely working, but repairable. Have extra AM/SSB RX and AM/SSB TX
chassis for parts units to go with this pair. Banana mic is complete with
original cord and plug (incorrect setscrews on plug), no stand and mic not
working (possible bad element). Some documentation included

4..... Two Cherokee CBS-1000 one box and one Cherokee stock hand mic $150.00
plus shipping for pair
inop/repairable - I have seen both of these rigs talk at various times.
Each time further repair was attempted, much further repair was needed.
They have lost their charm..... .PDF File included with service information

5..... Cherokee CBS-500 w/Cherokee Hand Mic (SOLD)

6..... Cherokee CBS-500 w/Aires (Sadelta) Power Hand Mic with Echo $140.00
plus shipping
110 VAC or 12 VDC. Has old, non epoxy-shrouded firmware with exposed and
functional option jumper header strip. Variable power has been added and
modulation limiter circuit not modified. External for dead key of 0 to 4
watts, now set at 2 watts. Very respectable audio quality with hand Mic and
a real performer with a power mic. Has 4 memory presets, Dual Watch, NB,
ANL, Auto Scan, Memory Scan, Instant channel 9/19, RF Gain, Headphone Jack,
External Speaker Jack, 12VDC power jack and Front facing speaker for limited
space installations. This unit has a 20 turn pot mounted in one of the
case screw holes (left front) for variable talkback that allows precise
setting without feedback for any operating combination. I can provide the
option of switchable vari-power if buyer desires, as rig has 2 mounting
positions for mini-toggle switches on right front side of cabinet that are
not occupied. Very solid performer, and with the old Display board
treatment no longer available in newer models. .PDF file of service info
included also documentation of vari-power addition

7..... Johnson 250 50th Anniversary / mic $50.00 plus shipping
In working condition with stock hand mic.

8..... Lafayette Comstat 25B $45.00 Plus shipping
Working but not collector quality. Good for parts unit to restore another rig

9.....President Dwight-T (No Outer Case or bottom cover) (SOLD)

10.... Robyn T-123B $50.00 plus shipping
Working, no apparent mods. Good for adding to the collection, but has signs of wear on front and paint chips on cabinet where bracket was mounted. Do not have tilt mount base stand that was an original accessory for this radio. A nice one, but not a great one.

11.... Two (2) Tram D201 $200.00 plus shipping for the pair
One complete (minus relay) and I have had it working to some degree in the past but would consider it to be inop for the purpose of this description. Second rig missing receive VFO and SSB indicator lamp, Audio and final tubes. Were purchased represented as complete and repairable... I will list them as almost enough to make one good working unit. Complete unit has Silver ID Tag with Yellow Diamond containing the "T" of Tram. Other unit has Black ID Plate with Tram in Silver and D201 in orange. I think at least one of them is referred as the "Ratsnest" version of the 201. Use for parts, repair or restore......

MOBILE RADIOS:

12..... Three Cobra 29 (SOLD)
.

13..... Two (2) Palomar Digicom 100 $150.00 plus shipping for pair
These are Mobile rigs with dual channel selector switches made for Palomar by CPI. Have service info with interesting possibilities. Rigs considered to be usable for parts or repair. No mics included, Will include SAMs Photofact (not copy).

14..... Two (2) Midland 13-857 w/ stock hand mics $40.00 plus shipping for pair
Were working when packed away. Crystal rigs, not the later "B" model with PLL02A. Usable for parts or repair; may still work, but 23 channel and not to be sold for on-air use.

15.... Uniden HR-2600 w/2510 firmware (SOLD)

MICROPHONES and ACCESSORIES:

Demco Modulator $50.00 plus shipping
Working.... 4 pin and 5 pin Mic jacks have been added to front panel, along with a 3 position/center off toggle switch to allow selecting original, large 4 pin mic jack or either of the 2 newer style mic jacks. Add some Audio to your vintage tube rig.

AMPLIFIER PARTS: (ALL SOLD)

Mako 300 tubes good - needs tuned input circuit (SOLD)

Palomar 300A - no tubes, parts robbed (SOLD)

++++++++++++++++++++++++++++++++++++

Speculation in NewsGroup is great, but would prefer serious offers via email.

Thanks to all who have already responded. More additions coming.......

On or about Thu, 28 Sep 2000 20:41:56 -0400, tnom@mucks.net, using the forum rec.radio.cb did say:
:For the money???? For the money the Firestik can't be beat.

I have to disagree here. The Wilson Silverload, which costs about the same as a firestik, seems to have outperformed the firestik on every installation I've ever had comparing the two, with the added benifit of being more easily tuneable. Of course, this is just my opinion and experience. Your mileage may vary.

Phil, I understand your fustration and concerns, but it really does not change reality. At the present time, for whatever reason, the FCC is not able to enforce the regulations in the CB band. Someone has to do it, because it is obvious that CB'ers are not going to do it themselves. And, with the FCC's inability to do so, that only leaves local law enforcement.

And I know that you feel that you're superior to local law enforcement officers (you have knowledge they don't), but these people already enforce a wide range of laws, so it is really not that much of a stretch for them enforce the rules concerning CB either.

In fact, considering the way the FCC has treated CB today (unlicensed, unenforced, local communications open to anyone), local enforcement might really be more relevant. After all, the problems are certainly a local issue.

Let see if I got this right. I can run a amp with my cb and if I have a ham
license the local pd can't do a thing to me right! only the fcc. so what we
need to do is get a ham license and then we can tell the local were to go
right or am I missing something here?

Commercial plane, No. Against FAA rules.

Private plane, Up to the pilot. We used to have a guy that ran a CB in his plane back in the 70's. Was a real interesting signal. None of the wavering or "flutter" associated with a moving object (Line of sight will do that). He regularly talked to people 4 states across, with just a stock radio. We had a hard time talking to him due to interference from all the other stations that were out of our range, but he could hear loud and clear.

There were commercial CB antennas made for airplane usage. I don't know if this is true anymore though...

Typical redneck mentality. Ignoring laws. That's really considerate of
you. People like you are the reason why these laws are considered in the
first place. I want to see you "ignore" this law when there's a cop at
your door.

> let the law pass , hell i hope the add a line in the bill allowing cops to
> inforce HAM regulations too .
>
> what piss's the ham's off is the if a non-ham like me gets caught with

> but if a HAM operator gets caught he will loose both his equipment , and his
> licence . and i am sure a loosing a yeasu would be alot worse than losing a
> galaxy.

You assume too much. I have no fear of any REAL problems arising from
this bill, since I run 100% legal on the ham bands. What is concerning
to me, and others that can actually THINK, is that the people entrusted
with enforcing this new law (if it passes) do not have the necessary
training in RF matters to make the distinction between a LEGAL ham (or
other licensed service) station, running high power, from an ILLEGAL CB
station and attempting to "enforce" an interference complaint, and then
having to "defend" ourselves unnecessarily, possibly legally for doing
NOTHING wrong.

> the way this law it written it does not shield them from loosing everything ,
> and that bothers them.

It bothers us when we are harrassed unnecessarily, and wrongfully. I
believe that if you can't do the time, you can't afford the crime. If
you run illegally, you have no right to be upset when you are finally
caught. You get what you deserve for ignoring the law. But when law
abiding people get harrassed by overzealous, and underinformed cops,
that's a problem.

7227. RCI-2970 TX Problem

Newsgroup: rec.radio.cb
Date: 2000-09-29 00:00:00 UTC
From: Richard Smith <rsmith@NOSPAMplaneteer.com>
Message-ID: <bw0B5.12523$YG5.26259@tor-nn1.netcom.ca>
Source record: 53738

I have an unusual problem with an RCI-2970. The problem seems to be intermittent and so could be difficult to track.

Sometimes, when speaking in a normal voice using SSB, the o/p will suddenly "squeal" at the peaks of the audio. If the user speaks in a low voice, this problem does not occur (but of course the receiving station can hardly hear you). Adjusting the mike gain etc. does not seem to help, nor does changing the microphone. Could it be possible that a peak in the audio causes some instability ? When the "squeal" occurs, I have noticed that the o/p meter on the front panel display goes full scale (all bars illuminated). Receiving appears to be fine, and no problems have been noticed.

Does anybody have any suggestions or at least a way of isolating the problem? I have a copy of the schematics and the service guide if anybody has any pointers.

The radio has had the following modifications prior to me receiving it:
- Panther AF power kit installed (Q51 replaced with a 2SB817 and Q53 replaced with a 2SA1012)
- Swing mod (a 1N914 diode placed across R285)

As I mentioned above, the problem seems to be intermittent. Last night I took the radio apart, unplugged and re-connected all plugs etc. in case something had worked loose during shipping (I only received the radio yesterday). This morning it seems to be working okay, but I would like to hear from anybody in case it happens again.

Thanks in advance.

Richard.

>
> How about ownership of 10m/11m amps by someone other than a ham?

Actually, owning the amp is not illegal; only using it. However, FCC and courts have ruled that mere possession of an RF amplifier or transmitter by someone not licensed to use it is "prima faci (sp?)" evidence that the holder has been using it illegally; i.e. if you even have such a device the burden of proof is on you to prove that you have never used it, not vice versa. That's practically impossible and fines are big!

My question is "Why put yourself in such a predicament when getting the license is so easy now days?". Go to <http://www.clicktron.com/ham/index.html> and try some of the practice exams if you don't believe me. Practice a little then go to <www.arrl.org> and find someone giving exams in your area. Trust me - these guys are not ogres, just the opposite, they are volunteers hoping you will pass and will usually bend over backward to help you do so. Start with the new no-code Technician and you have all Ham priviledges from 50MHz up, including access to all the 2-meter repeaters. Learn just 5 word-per-minute code and pass the new "general" exam and you don't have to hide your linear under the bed any more. In fact you don't have to DX on CB, you can choose the band that's open from several spread across the HF spectrum just for that purpose. And you don't have to give up CB either. Be listening for you.

Sounds like some tweaked the bias adjustments for the driver and finals while tuning for Max AM output. Try setting them to specs and see if this cures the problem. Also, wiring harness should be able to provide enough current to power the 100 watt amp attached to the rig. Make all of your connections tight, straight to the battery and be sure a harness from a low output rig hasn't been used.

Good Luck,

David

Hey Prof. I think you hit the nail on the head. Till the FCC
supplies more bandwidth to citizens band I think you are just going to
see more and more of this. Where I live you can't find a clear
channel to talk on. Too many radios, not enough channels.

Well I agree... I for one never go off the CB band.
That's part of the entertainment! lol

Just for the sake of discussion.
If you put a encrypted message on a web site, then the recipient
could see it without anyone being the wiser.
With anonymous websites being a dime a dozen (I've got 3 myself)
You can "Send" a message to who ever you like.....
All they have to do is go to the proper website and pick it up.....

If my memory serves correctly their were several CBs with tone keys for "CW" operation. Of course it defeated the whole purpose of ease of conveniance but I think it was legal....

Your showing your age.... Those things weren't availble except to the
military. CB's came out in the late 60's early 70's wayyyy before
PC's

Thats like putting a satellite dish on a buckboard wagon.....

7259. Re: CB on aircraft in flight???

Newsgroup: rec.radio.cb
Date: 2000-09-29 01:17:49 UTC
From: Eric Oyen <n7zzt@home.com>
Message-ID: <39D32ABD.2EC916A1@home.com>
Source record: 53704

As of the spring of 1998,
the FAA issued changes to the Flight Aviation Rules that specifically
prohibit
the use on transmitters abord commercial aircraft. it also forbids the
use of other
radio recieving equipment.

Some devices may be approved 9such as laptops and cd players).

However, use of CB/ham equipment on board commercial flights
are strictly prohibited and heavy fines can be imposed immediately
by the carriers and the federal Govt.

We have here a 2950 that we are having problems with no TX and RX and no front display. Troubleshooted and decided to change microcessor board. Display reappeared but still no TX or receive. Cannot locate problem.
Does anyone no anithing about this problems????

Thanks in advance

I remember about 3 or 4 years ago, in the central CT area, we used to get an aviation talker on CB once in a while (only a few times really). We could hear him talking to NY and MASS at the same time. At first he didnt want to identify himself, and became evident after he dropped enough clues for our resident aviation expert (thanks Baked-Bean !) to figure out it was a KC 135 re-fueler out of Bangor, ME..(military types correct me if im wrong). The TX and RX capabilities out of a belly mounted antenna made line of sight seem like a play of words.
I'm not gonna print the handle the guy used, but e-mail me if you know him or his handle. I mostly heard him on 27.345, but imagine he jumped around.
Oh well, time fer a beer.. See ya

FWIW, my 2 meter fm pulls about 8 amps when keyed, so you would need at least a 10 amp supply.

It is the FCC's job to deal with ANYONE using radio, not local
law enforcement's job.

This Bill is a pure cop-out to avoid giving the FCC the
proper tools to do its exclusive job. Contracting it out to
the "locals" is not like contracting out washing the windows
in the FCC office building.

I've ranted about this for three years now.....

>> An ostrich with its head in the sand?

The Feds (the FCC) are responsible for enforcement of ALL radio
regulatory rules.

Does nobody else see the idicy of giving sway this
responsibility to non-technically-qualified and non-committed
entities?

Dwight, I've WORKED at that job on both sides of the street,
so to speak. I had sufficient technical training (both as a
ham and as a degreed EE) and it was like pulling teeth to get
the average non-technically-oriented officer to understand the
problem, let alone to get the right solution the first time.
It's not quite the same as taking an assault-with-intent
report.

Believe me, this is NOT a job for a non-radio-technical police
officer.

>A CB radio is supposed to have

If radio law enforcement was only that simple..... <sigh>

You're missing the point ....It's a question of POLICY.

The "locals" should have no business getting involved in this
any more than the FCC should have any business getting involved
in investigating car thefts.

There is no need whatsoever to upset the clear delineation of
jurisdiction that has existed for almost a century, other than
Senator Feingold's personal peeve (nice language for being
pi**sed off) because the local FCC office did not junp when his
constituent called. That is well known amongst us pros in the
business as the sole reason for this Bill. Did the good
Senator ensure that there was enough agency resources (staffing,
budget, equipment, and empowerment from the top) for the field
office to do what he thought that they ought to do?

The drafters and supporters of this Bill think that it will
"relieve" the FCC's workload by having the "locals" do CB
enforcement. Not so. The Bill as drafted by Senator Feingold
contains a provision for removal ("appeal") to the FCC. This
will result in MORE workload for the FCC because anyone who
has any sense (or an attorney with any sense) will immediately
petition for removal of the matter from the local jurisduction
to the FCC. Back to square Minus One.

On Thu, 28 Sep 2000 19:51:51 GMT, D. Stussy wrote:

>Then why is the FCC a bureau of the Commerce Department?

It is not.

The FCC is an independent regulatory agency (just like the SEC), set up by The Congress by the Comm Act of 1934 to incorporate the broadcast regulatory functions of the former Federal Radio Commission (set up in the Radio Act of 1927), the wireline regulatory functions of the Interstate Commerce Commission over Western Union and ATT and the Post Office over Postal Telegraph, the marine radio regulatory functions of the Navy Department, and the regulation of all other service formerly done by the Department of Commerce.

The five Commissioners are nominated by the President and confirmed by the Senate. The Prez names one of them as Chairman, and cannot remove any at whim.

The Congress tells the Commission what to do by means of budget and authorization bills. amendments of the Comm Act, and oversight by Senate and House Commerce committees.

In reality the Commission is a creature of Congress although For all intents, Commission employees and operational procedures (personnel actions, pay scales, procurement, etc) are subject to all the rules and orders applicable to the executive branch even though the Commission is not an executive branch agency.

>> > I agree with the laws in question (including the proposed one).

Since when was a "common sense interpreation of the Constitution"
held to be the standard used to determine the law of the land
by the courts, who are the final arbiters of "what's the law"?

>The Supremes have been wrong before -

Yes ... in an Advanced Constitutional Law course a mumber of
years ago I wrote an exam paper showing where the Supremes were
wrong in a "separation of church and state" case (Allegheny)
and that the holding that they arrived at was what was needed
to support a "popular" but clearly wrong action. The prof thought
that it was brilliant, but the Supremes weren't about to be
reversed and the law as set forth in that case is still the law.

Depends on the radio it's used with and your voice pitch. Astatics are a little "bassier" than Turners, Turners tend to be a little "sharper". I picked up an old Shure noise canceller from the 70's new off ebay,
now THAT is an awesome mike. I don't think they make them anymore, what a shame.

...And it also says that the equipment is NOT to generate interference to other licensed users of the same frequency set.....

That is an issue that I have - someone's 2.4GHz cordless phone is coming through on my repeater's 2.4 input (sometimes - not every time they use it). However, how many consumers really even bother to read that part 15 warning in the device's manual. 900 MHz and 2400 MHz have been trashed by appliance manufacturers.....

I think I saw some antenna's being sold as "stealth" antennas! Very small, black (?), and just stuck to the inside of the glass. Don't recall the name.

With all the "back doors" to software that the government is supposedly requiring I'm not sure that I would even trust PGP that much. Someone once said that the only way to REALLY encrypt a message is for two (or more) people to have EXACT copies of book or document and let each letter (or number) represent a page, line and character number. This could be very time consuming and messages would have to be kept short, or have a program to "convert" it for you, in which case you risk it being "captured" and all future correspondence being exposed.

I was one of the original posters saying that CW was legal on CW as the ARRL manual said it was legal on all bands. I have since found the specific laws dealing with that (I don't have the URL handy, but it's through the FCC website at http://www.fcc.gov) and they state that only voice is legal on CB.

Those don't work worth a flip...not compared to a "real" dedicated antenna.

It's a question of knowing what you can change and knowing what you can't change, and directing your effort appropriately. I really love your attempt to compare illegality to poverty, mental illness, and ignorance. Just doesn't work though.

the only units I know that tone keys were the little 100 mw hand held
toys...these operated on ch 14 and wern't covered by FCC rules and
regs.

Source record: 53811

>>You are correct here. A ham operates outside the Ham bands can lose
equiptment
and most likely his/her own license. But really that doesn't bother most hams.
What really bother many is your total disregard for the laws that allow you to
transmit on the CB band. A character like you may just as well as diregards any
law that is of no liking to you. You feel that the FCC rules and regualtions
have no bearing on you and proceed to act and do as you please. Thus chaos
rules
the band that once was intended for short personal low cost communications.
That
is what really burns most hams.

jsut an opinion

james<<

whats gives hams this holier than thou crap ?
hams are not any better than cb'ers .

in fact if a ham breaks a law it is MUCH worse since he actually had to study
and apply and test for his licence . when a ham use's his kenwood on 11 meter
that is much worse than a cb'er usung a galaxy on 11 meter .

the hams "golden ticket" isn't a shield .

what really " burns most hams " is thata cb'er have very little to loose when
useing illegal equipment . the FCC does not have the manpower to investagate
ever Cb'er . or even every report on TVI and such . hell , that group in
arizona , one of which i know for a fact is a ham . has been running massive
power on 27.555 , just to piss off the alfa tanga's .
and guess what if the do invesgate them down there , is the HAM operator that
will loose everything first . then the cb'er , and in a monththe cb'er will be
up and running again . while the HAM will have lost possible thousands in
equipment , and his ham licence .

so my responce is , passing , and if it does it will be years before it has
any effect , IF it has any effect at all .like they are gonna have a CB SWAT
TEAM . to search and destroy us rampaging CB'er .

get real , get a life . worry about your own shit , not mine

New to the CB thing and use mostly for driving the interstates but have been picking up a Papa Smurf from Paducah, KY to Cincinnati, OH. Anyone know where this guy is...

BTW, this is always during the peak hours of the day 2-5pm EDT.

Do any of the independent commissions have their own committees? Do we
really want them to?

Hell, the feds. don't give a damn about the cheapie cordless phones. Technology has improved somewhat, but not enough. Wasn' t too long ago you could buy the cheapest cordless that Walmart or Kmart sold, ride around the neighborhood in your car with it until you found a dial tone, park, and make all the long distance calls you want.

7311. Re: whats got the ham's panties in a bunch ?

Newsgroup: rec.radio.cb

Source record: 53817

One of the problems is that cb has evolved into a hobby, not just a means of short distance communication and the feds really have not grasped this aspect accordingly. Such is the case of them shooting down the proposal of broadening the distance limitations for cb.

Food for thought:
When the locals get a whiff of the fine schedules (read: NAL Forfiture)
which the FCC levies, the revenue enhancement factor will kick in and
the money for schools, roads and hospitals will be rolling in, who
knows. This is why the Article about "Commercial Vehicles" was added to
the Bill. It merely states that a "Commercial Vehicle" can not be
stopped for merely having an Antenna or merely to check CBs or other
"radios," there must be "Probable Cause" for the stop and that cause
would be evidence of transmissions in violation of Part 95.
Food for thought.

A similiar Bill to this one passed the Senate 2 years ago (Fiengold's
Bill) so it would probably have no problems (Vote 99-0) when added to a
Slaming Bill (97-98) Session. Monica saved the day, however no Monica
problems in sight and the Congress (Senate included) is trying to wrap
up the session, so some surprises could be in store.

Maybe so, but they're still in close proximity to other surfaces and have no groundplane. While antennas can be designed and work satisfactorily under these conditions, they are stil a compromise over a full-sized vertical antenna with a groundplane.

7317. If You Have A CB Or Ham Related Website, Check This Out!

Newsgroup: rec.radio.cb
Date: 2000-09-30 00:00:00 UTC
From: charger383@my-deja.com

If you have a website that has something to do with CB Radio, Ham Radio, whether it be personal or
commercial, mobile audio, electronics in general, modifications, amplifiers,,,

Come on by and post your link on our new FREE link submittal page at www.cbcity.com by a button on the left hand side of the main page or by clicking on or typeing in the link below.

http://pub25.bravenet.com/freelink/show.php?usernum=2116731255&cpv=1

This will help everyone find the things they are looking for, and the best thing is that it will send new customers to your website and it cost's absolutely
nothing.

Come on by and submit your link now!

During WW2, systems were developed for heating with RF. (for curing glue, I believe) During the war, if it helped military production and didn't interfere with military communications, niceties like Part 15 could be ignored. But with the war over, radiating trash willy-nilly across the shortwave bands ceased to be acceptable. The manufacturers asked the FCC to assign 25-29MHz as a band where they could operate industrial RF heating equipment legally. When the FCC stopped laughing, they told them to shield their equipment. They couldn't shield it that well. They finally comprimised, stabilizing their gear & getting 26.96-27.23MHz assigned. It was known as an "ISM" (Industrial, Scientific, and Medical) band; they could radiate if they had to, as long as their radiation stayed within the band.

I presume those frequencies are familiar. They were originally assigned as a ham band, with the understanding that hams would tolerate any interference received from the ISM equipment. (presumably no ham could radiate enough power to interfere with the ISM gear!) The interference didn't turn out to be as severe as feared, and in 1958 the band was reassigned to CB, which uses it today.

The 900 and 2400MHz bands are also ISM assignments.

7331. WANTED===>[HACKED OR DAMAGED GM300's]<===

Newsgroup: rec.radio.cb
Date: 2000-09-30 00:00:00 UTC
From: msisco9939@aol.com
Message-ID: <20000930134321.01358.00000838@ng-md1.aol.com>
Source record: 53837

Hi:

I am still looking for Dead or Alive Motorola GM300's so long as they
do not have been subjected to water damage or a major Logic Board
repair. PA's Mother boards can be compromised. This are going to be used
for traning purposes, so acc'y are not really needed.

So, if you have a old GM300 laying around collecting dust, and you want
to get the biggest bang for you bucks, Cash is wait for it. Or if you desire
I have lots of Motorola stuff to trade as well

Please let me know what'ca have.

Monty

A buddy of mine lives across the street from a hospital. He gets interference on a regular basis. Thinks it's the MRI machine. Just as recently as this summer, I went through an area where they were putting in new parts of the turnpike in Pa. and saw a sign that said, "warning: blasting in effect. Please turn off all cb and 2 way radios".

7336. Re: whats got the ham's panties in a bunch ?

Newsgroup: rec.radio.cb
Date: 2000-09-30 00:00:00 UTC
From: jamesrhampton@my-deja.com
Message-ID: <8r5ctj$81d$1@nnrp1.deja.com>
Source record: 53842

While everyone seems to have their panties in a bunch, here is something to think about - and it bothers me a bit. The problem I see with locals doing the enforcing is exactly the same problem we have with traffic enforcement. Ever been to a town where they tend to ticket the non-locals a lot? Ever given a traffic ticket for failure to stop (that was a rolling stop - you didn't stop) when you darn well DID come to a complete stop and you know it? The problem is that some local governments will smell money. If politicians smell money, kiss it good-bye! You can bet the enforcement will be spotty, uneven, and in some cases unfair. In many areas, life will go on as ever. Heaven help you if you live in one of the areas where they decide to make money by issuing tickets! Well, the legality of roadblocks has been decided (good idea to keep the drunks off the road) - next, will it be a radio check? (hey, let's get all the modified radios off the air! Gee, what a good idea - especially if the locals can fine you a couple hundred bucks!). Gee, maybe they can lower taxes some more! (I wonder where all this buget surplus came from? My guess is the tobacco settlement and raising cigarette taxes is not hurting the equation any). Sorry for the length of the post, but I do have a concern here. Thanks for letting me gripe!

73s from Rochester, NY
Jim

Date: 2000-09-30 00:00:00 UTC
From: cbbadboy2@aol.com
Message-ID: <20000930171809.16045.00000389@ng-ct1.aol.com>
Source record: 53852

i beleive the tnt kw is a very good amp, yes they do run hot, but overall it is a great talking amplifier. for the swr alot of people don't know is that inside the amp there are input and output tuning. my swr's are 1.4 coming out of the amp and about 1.1 going into it. i have been running this amp for 5 years and have never had any problems with it, you just might want to put in a fan, good luck i hope this information is helpful.

7347. TazMan Built amps

i agree, here in this town they use the police as an unofficial taxing agency. i think they are more involved in writing tickets than they are in law enforcement. oh when you are speeding they are johnny on the spot to give you a ticket, but where are they when somebody steals something from you, etc. they should be patroling neighborhoods looking for bad guys or investigating crimes , etc, instead where are they. sitting in some inconspicuous spot waiting for you, mr john q citizen to come by, day dreaming and speeding. it makes you wonder when people are going to wake up. they after all do , i believe work for us , don't they? but try telling some of these idiots that and see what happens. to tell you the truth, the only way you can get away with anything is if you are politically connected and/or rich and that is about it. everybody else , look out. oh this thing with the radios will give the fuzz, more fun things to do instead of doing what they were hired to do. think about it, it is much easier to pull you over for having a loud radio than going in the hood looking for a drug dealer, know why , cause the dealers are better armed than they are. they don't want to have to get shot at, oh well, cd back in the bushes, reading the mail.

Looking for a Yaesu FL-2100 Plate Current Meter, its the one that mounts in the left hand side of the face plate on a Yaesu FL-2100 Amplifier.

Thanks

Jay in the Great Mojave Desert.

7352. Re: CB on aircraft in flight???

Newsgroup: rec.radio.cb
Date: 2000-09-30 00:00:00 UTC
From: Bendthelite@webtv.net
Message-ID: <21551-39D6631D-14@storefull-118.iap.bryant.webtv.net>
Source record: 53858

I do not know if its legal for 11 meter operators to transmit from aircraft or not. But about 3 years ago there were some airforce types who would transmit from a jet aircraft as they flew over the state of california.

They claimed to have taken off from an air base in the california desert, and were headed to either washington or oregon. I asked them what type of aircraft they were flying, and they told me it was an aerial refueling aircraft. I then asked if it was a KC135, and the reply was that it was an older 707 4 engine jet aircraft.

You could hear a subtle jet engine sound when they keyed up...and the signal strength was increasing rapidly, so i asked them where they were at, and they named a city about 80 miles away. I went outside with a pair of binoculars and a Cobra 45 WX walky talky, and in fact did see a large 4 engine jet fly over after a few minutes. I was actually able to talk to these people on my handheld for several minutes.

They said they were flying at something like 35.000 feet, and would break for people using the line....' anybody want to talk to the jet '

They did make the remark that they only transmitted on Cb every once in awhile because they were not really supposed to.

A non licensed amateur is not allowed to build or modify any amp equipment and any licensed amateur is forbidden by law to sell such an amp to a non licensed person except a dealer who is also forbidden to sell to a non licensed person. Ownership of an amp by a non licensed person sounds to me like a good indication that a law has been broken by someone.

>
> ...And as I have said in another RRA newsgroup (see "eBay and the sale of

If selling can be an illegal act and building can also be an illegal act then possession sounds like it could also be an illegal act since it is dependent on one of the other illegal acts taking place. Your thoughts?

>
>
> [Granted that the regulation does state that possession implies a presumption

They were/are covered under CFR Part 15. Low-power Part 15 bands exist throughout the spectrum. Part 15 is what permits you to transmit QRPp CW on the AM broadcast band, use wireless mics on the FM broadcast band, et cetera. Even your garage door opener operates under Part 15 rules. One of my build-it-yourself books contains a Part 15 transmitter for unlicensed (but legal) CW operation on 80m! 73, Jeff KH6O

You hit it on the head, CD. Cops can actually earn their stripes now without even ever having made a felony arrest. As you stated, the connected ones are the rising stars. Damn right they are outgunned. But as we see in California and other places, they aim to take care of that too. Then who will protect the people? "Cause right now in the inner city (in Miami anyways) the best deterrent is armed citizens.

Yea, Jim. There are a few jerkwater, backwoods towns here in the 'pile like that. Check out Triple A books. They warn their customers about two towns in particular that receive something like 80% of their revenue through unjust traffic violations. These are the only places that Triple A DESIGNATES a traffic TRAP. I don't have the figures on hand, but a little research will yield the population of Waldo and Lawtey on U.S. 301 along with the revenue they collect. It will leave you astounded. Any driver that regularly gets to Fla. is aware of "Waldo Willie". Those yocals will have a blast with a bill like that.

I believe the military radios will talk anywhere they will tune. I know
I have talked to military pilots or crew on 20 meters on several accas-
ions. As long as the crewman has a valid license, I don't think it's
a problem although his superiors might disapprove of it. Whether CB
or ham, I suppose the guys get bored on long flights.

> Which noise canceling mic has the best fidelity?

Did you try opening the DF mic and turning that pot down?
I had a friend talk on mine after I did that and it was MUCH better.
It sounds awesome!
Then I drove away from him with the windows down, and he said I had very
little background noise.
I guess they crank it wide open at the factory.
Try it, you'll like it!
Beats buying a mic.

TH,

Go to: www.speedtrap.com

If you have a fairly recent browser, you can read about hundreds of towns that entrap outsiders. Two states that scare me are "Jaw-ja" and FLA. There used to be a town that was so bad, the state itself actually posted a sign on the interstate on both ends saying that XXXXX was a speedtrap and to slow to 50 MPH to prevent them from steal-ing your money! Another town on I75 did very well from fines. The cop was the brother of the judge. Yessir, they did well-----until one day they stopped a FEDERAL Judge from Washington, DC. By the time the Justice Dept and the FBI got throught with them, their pants were smoking like an over volted amp! LOL!

Look, as far as most people are concerned, the FCC has done a really poor job over the last 25 years when it comes to enforcement of CB. In other words, the FCC did a crappy job of policing CB in the 70's, a horrible job of it in the 80's, and hardly anything at all in the 90's.

FCC enforcement has become a joke in the CB community, with widespread abuse of the regulations now commonplace. By my estimate, there are now more people openly selling illegal CB linears than there are people selling legal linears for all the other radio services combined.

And, throughout that 25 years, I can only imagine how many millions of complaints were sent to the FCC, with most of those complaints largely ignored. Or how many millions of frustrated neighbors have had to sit through interference of their telephones, televisions, or other electronic devices, over those same years.

Anyway, the point is that this situation existed long before Finegold, or most of the other members of the current Congress, ever stepped foot in Washington. So, in my opinion, it is rather disingenuous to point at them for what I, and many others, see as a clear failure of the FCC to

enforce the CB regulations.

Sadly, at this point, given how widespread the problem has become, the only way the FCC could enforce the regulations would be to increase its enforcement staff greatly. And I don't think most Americans would want to see another hugely expanded enforcement agency in Washington. In my opinion, we already have way too many cops in Washington as it is.

So, the only solution left is to allow local enforcement. In other words, in my opinion, even bad local enforcement would be far better than what we have now from the FCC (which is virtually no enforcement).

But, there is no reason that bad local enforcement has to be the end of the story on this. The FCC is being given a new job when it comes to CB enforcement - that of mentor and guide. If they do this job well, then bad local enforcement can be minimized. In other words, lets hope they do this job better than they did the job of CB enforcement over the last few years.

Dwight,

You'd have to blame Congress for the sorry state of enforcement on the Federal level. They reduced their budget to the point they couldn't.

Without a massive hiring/training of agents, they would never be able to stop the incursion of bootleggers onto 10/12 meters. They ARE trying, and in fact, from what I am hearing (speculative, perhaps), there is to be more of the following in the works.

J

* FCC upholds forfeiture for illegal amplifier sales:
The FCC has denied a Petition for Reconsideration and upheld a $7000 fine against The Two Way Shop of Kennewick, Washington. The shop was fined for willful and repeated violation of the Communications Act of 1934 and FCC rules by offering illegal linear amplifiers for sale. In a May 3, 2000, response to the FCC's earlier Forfeiture Order, the Two Way Shop alleged that neither its owner-operator nor his wife had spoken with FCC agents in the shop and, accordingly, could not have offered to sell linear amplifiers to the agents. "The Two Way Shop apparently overlooks our statement in the Forfeiture Order that the investigating agents posed as 'members of the general public'," the FCC responded in a Memorandum Opinion and Order released September 14. The FCC said the agents' decision to go under cover had no bearing on The Two Way Shop's culpability, and it denied the Petition for Reconsideration. The Two Way Shop was given 30 days to pay the fine.--FCC

7379. Re: New Law?

Newsgroup: rec.radio.cb

As per your request, I will try to answer your question on rec.radio.cb.

Several Congressmen have introduced (once again) a bill to allow local law enforcement to enforce Federal law pertaining to CB radio. Seems than one of these MCs had lots of complaints from his constituents at home about interference from CB amps, and modded radios bleeding over onto their consumer appliances. Thus, this Bill!

It applies ONLY to CB radio and all ~licensed~ services are exempt from local law enforcement. This exemption applies to hams as well. It has not passed----yet. But given the problem of illegal linears, free-banding, and encroaching onto the 10 & 12 meter ham bands, there is sure that something, sometime, will be done. Basically, that's about it. Hope this helps.

Jerry

<<Subject: IARU MONITORS SEEK REPORTS ON UNLICENSED OPERATION
From: Martin <A HREF="mailto:mdwade@mobiletel.com">mdwade@mobiletel.com</A>
Date: Fri, Sep 29, 2000 11:42 PM

IARU MONITORS SEEK REPORTS ON UNLICENSED OPERATION

In an effort to better document the extent of unlicensed operation on Amateur Radio frequencies--particularly 10 meters--the International Amateur Radio Union Region 2 Monitoring System is surveying member societies about the extent of the problem. The ARRL is soliciting reports from US hams to supplement its response to the survey.

"At the peak of the sunspot cycle, CB-like operations become more and more apparent on the highest HF band," says Brennan Price, N4QX, administrator of the ARRL Monitoring System.

Price says that on September 28 alone, the ARRL received three reports of such activity on 10 meters. "John Hennessee, N1KB, and I took turns monitoring at headquarters station W1INF and noted 12 such stations in about 15 minutes of listening time--all using AM between 28.0 and 28.1 MHz," he reports.

In order to provide statistical backing for ARRL's survey response, Price is soliciting reception reports from amateurs for the two-week period October 1 to October 14. Observations should include date and time in UTC, frequency, mode of the transmission, language (if known), and any notes that might assist in identifying the source. Observations should also be limited to amateur frequencies, focusing on 10 and 12 meters.

Price emphasized that operations on the so-called "freeband" between 10 meters and the 11 meter Citizens' Band are not a topic of this survey.

Price urged monitors to use caution before documenting a transmission as probably unlicensed. "Most countries do not mandate a segregation of voice and digital modes, as the US does," he pointed out. "A phone transmission between 28.0 and 28.3 MHz is not necessarily illegal in the country where that transmission occurs, and if valid amateur call signs can be made out, the transmission should not be reported." Price notes, however, that lower sideband and AM transmissions between 28.0 and 28.1 MHz usually are unlicensed "and may be treated with suspicion."

ARRL Executive Vice President David Sumner, K1ZZ, said he believes the best short-term solution is for amateurs to get on the air and use their frequencies. "Illegal operation on 10 meters declines on a contest weekend," Sumner says. "If that volume of stations would operate more often, perhaps these intruders would look elsewhere for an open frequency."

E-mail reports to Brennan Price at n4qx@arrl.org. All reports will be acknowledged, and respondents will receive a summary of the survey results via return e-mail.

Hey, I worked for the FCC for 28 years and I KNOW that the
FCC is NOT part of Commerce. The Secretary of Commerce has no -
zero - zippo - authority over the Commissioners or the agency
operation, and the agency's authorizations and budget are
totally separate from those of the Commmerce Department.

This is clearly spelled out in the Communications Act - Title
47 US Code and in the Commission's Annual reports. Read it.

Charlie, the three most important things in a good radio set up are:

1.Antenna
2.Antenna
3.Antenna

Here is a site to get some antenna basics:

http://members.stratos.net/cwe146/index.htm/FB_home.html

I have no personal experience with it , but I have read that the Uniden Washington is a good basic base station CB. Others here on NG can perhaps comment on that advice. They are about $190 mail order.

7391. Re: HR 2346 STATE & LOCAL COPS TO ENFORCE CB RADIO REGS

Newsgroup: rec.radio.cb
Date: 2000-09-30 05:14:31 UTC
From: jdaggett@gate.net
Message-ID: <39d56390.19698871@news.gate.net>
Source record: 53777

Very well researched. One small ommission though. You have failed to post HR2346EH. This bill has now passed the House on 9/27/00. It is not a public law as of yet. It must now go before the Senate to be voted on. It first must go to Senate committies and then be brought before the whole Senate. The following things can happen to this bill:

1) the Senate can argee 100% with it and present it in it's present form to the floor for a vote.

2) Senate committes can add admendments to it prior to sending the bill to the floor for a vote.

3) the Senate can refuse to consider it this Session and thus send it back to the House.

4) the Senate may find fault with the bill and send it back to the House for reconsideration.

Personlly looking at the bill the House has failed to list how the appropriations will be made to local governments if any is inferred. While the bill states that the FCC will render technical assistance, in what form?
Is it strictly in help in writting ordinaces and statutes?
Is the FCC involvement strictly how to enforce statutes and ordinances?
or just simply how to use equipment to detect illegal operations. From appearances of this bill, all funding shall be by local and state governments and none from the federal government. Yet this is implied but not clearly stated. This appears to be the grey area of the bill that may find admendments to it.

The strong points of the bill is that the FCC will still retain it's enforcemnt capabilities over local jurisdiction. Just because the local township or city passes ordinances to restrict actions on the CB band, the Federal government is not giving up it's jurisdiction to also enforce the Communications Act of 1934. Thus the local laws can not supercede the federal law.

Now this lead into section 7 where some people have questions. The phrase:

" `commercial motor vehicle,' as defined in section 31101 of title
*49, United States Code "

simply refers to to Title 49USC Section 31101 as to the definition of what a comercial vehicle is. This in no way restricting this biull to "commercial vehicles". What this section is stating that a commercial vehicle must have probable cause in order to be searched. Below is Title 49 USC Section 31101:

Sec. 31101. Definitions

In this subchapter -

(1) ''commercial motor vehicle'' means (except in section
31106) a self-propelled or towed vehicle used on the highways in
commerce principally to transport passengers or cargo, if the
vehicle -
(A) has a gross vehicle weight rating of at least 10,000
pounds;
(B) is designed to transport more than 10 passengers
including the driver; or
(C) is used in transporting material found by the Secretary
of Transportation to be hazardous under section 5103 of this
title.

Thus a commercial vehicle with 10 or more people, it must be first determine as to who is violating the law. In order to stop, detatin and assertain who has broken an ordinance or statute, there has to be justification.

I still potential challenges to this law. Will local ordinances and statutes have the right of confiscation of equipment? What fines and/or icarceratoin penalties will be imposed. Can they exceed the standards set by the FCC?

Finally is this bill Constistutional?
If the right to transmitt is conveyed by the Federal Government, can they abrigate their right of enforcement to the states and locaal authorities? While the FCC is not giving up jurisdiction, they are giving power to state and local authorities to act as agents of the FCC. Is this constitutional? Doing so means the local authorities now act on behalf of the federal government. I would think state's rights people may have problem with this. The only thing to me that gives precidence to this is that the FBI can and has used local law enforcement agencies in criminal apprehension. Thus if the FBI can use local law enforcement then why can't the FCC. In those cases, the FBI has agents present. In this case the FCC may not. Thus a local law enforcement is acting on behalf of the FCC, a federal agency. I argue that there is no precidence for this bill and it is unconstitutional.

just some random thoughts

james

*H. R. 2346
*To authorize the enforcement by State and local governments of certain
*Federal Communications Commission regulations regarding use of citizens band
*radio equipment.
*
*IN THE HOUSE OF REPRESENTATIVES
*June 24, 1999
*Mr. EHLERS (for himself, Mr. COBLE, Mr. DINGELL, Mr. UPTON, Mr. HOBSON, Mr.
*HOEKSTRA, Mr. TRAFICANT, and Mr. CAMPBELL) introduced the following bill;
*which was referred to the Committee on Commerce
*
*A BILL
*To authorize the enforcement by State and local governments of certain
*Federal Communications Commission regulations regarding use of citizens band
*radio equipment.
*
*Be it enacted by the Senate and House of Representatives of the United
*States of America in Congress assembled,
*
*SECTION 1. ENFORCEMENT OF REGULATIONS REGARDING CITIZENS BAND RADIO
*EQUIPMENT.
*
*Section 302 of the Communications Act of 1934 (47 U.S.C. 302a) is amended by
*adding at the end the following:
*
*`(f)(1) Except as provided in paragraph (2), a State or local government may
*enact a statute or ordinance that prohibits a violation of the following
*regulations of the Commission under this section:
*
*`(A) A regulation that prohibits a use of citizens band radio equipment not
*authorized by the Commission.
*
*`(B) A regulation that prohibits the unauthorized operation of citizens band
*radio equipment on a frequency between 24 MHz and 35 MHz.
*
*`(2) A station that is licensed by the Commission pursuant to section 301 in
*any radio service for the operation at issue shall not be subject to action
*by a State or local government under this subsection. A State or local
*government statute or ordinance enacted for purposes of this subsection
*shall identify the exemption available under this paragraph.
*
*`(3) The Commission shall provide technical guidance to State and local
*governments regarding the detection and determination of violations of the
*regulations specified in paragraph (1).
*
*`(4)(A) In addition to any other remedy authorized by law, a person affected
*by the decision of a State or local government enforcing a statute or
*ordinance under paragraph (1) may submit to the Commission an appeal of the
*decision on the grounds that the State or local government, as the case may
*be, enacted a statute or ordinance outside the authority provided in this

*subsection.
*
*`(B) A person shall submit an appeal on a decision of a State or local
*government to the Commission under this paragraph, if at all, not later than
*30 days after the date on which the decision by the State or local
*government becomes final, but prior to seeking judicial review of such
*decision.
*
*`(C) The Commission shall make a determination on an appeal submitted under
*subparagraph (B) not later than 180 days after its submittal.
*
*`(D) If the Commission determines under subparagraph (C) that a State or
*local government has acted outside its authority in enforcing a statute or
*ordinance, the Commission shall preempt the decision enforcing the statute
*or ordinance.
*
*`(5) The enforcement of statute or ordinance that prohibits a violation of a
*regulation by a State or local government under paragraph (1) in a
*particular case shall not preclude the Commission from enforcing the
*regulation in that case concurrently.
*
*`(6) Nothing in this subsection shall be construed to diminish or otherwise
*affect the jurisdiction of the Commission under this section over devices
*capable of interfering with radio communications.
*
*`(7) The enforcement of a statute or ordinance by a State or local
*government under paragraph (1) with regard to citizens band radio equipment
*on board a `commercial motor vehicle,' as defined in section 31101 of title
*49, United States Code, shall require probable cause to find that the
*commercial motor vehicle or the individual operating the vehicle is in
*violation of the regulations described in paragraph (1). Probable cause
*shall be defined in accordance with the technical guidance provided by the
*Commission under paragraph (3).'.
*

*
*let the law pass , hell i hope the add a line in the bill allowing cops to
*inforce HAM regulations too .
*
*what piss's the ham's off is the if a non-ham like me gets caught with
*illegal equipment , more than likely it will just be seized .
*but if a HAM operator gets caught he will loose both his equipment , and his
*licence . and i am sure a loosing a yeasu would be alot worse than losing a
*galaxy .
****

You are correct here. A ham operates outside the Ham bands can lose equiptment and most likely his/her own license. But really that doesn't bother most hams. What really bother many is your total disregard for the laws that allow you to transmit on the CB band. A character like you may just as well as diregards any law that is of no liking to you. You feel that the FCC rules and regualtions have no bearing on you and proceed to act and do as you please. Thus chaos rules the band that once was intended for short personal low cost communications. That is what really burns most hams.

jsut an opinion

Ps: as written I think the Senate may not pass it or at least not in this year. I look to see some admendments to it. Maybe minor ones but one or two. Even if it does pass, how many city commissions, state legislatures and county governments are going to find the money to staff a team to enforce ordinaces and statutes that are to be enacted? Maybe in the some cities, but most when the realization that tax money needs to be spent on schools, roads and hospitals,

finding money to enforce FCC rules and regulations are not gonig to have high priority.

james

Yup. As long as the ham equipment is operating properly and legally.

Probably because it's posted on my resume's on monster.com, dice.com,
et al....

Come now, you must be able to do better than that.

Post the URL.

Of course its correct...

Any search of most major IT jobsearch sites for my email address will pull up my resume. At the top of my resume is my address and contact information. So you've taken another route to get personal information. Big deal. It still doesn't prove you've been on my website. Post the URL, or keep talking out of your ass. Either way, it still proves nothing. Game's attempted insult fizzled and died.

I think I've shown that Game was talking out of his ass... and now that WildBill is doing Game's talking for him, that implies a much closer relationship between the two than previously thought. Hrm...

Oh, and get your facts straight... It's not getty, it's Petty. you posted the correct name when you cut and pasted from my resume off one of the jobsearch sites, but you still can't type it right. The address you posted is also in direct contradiction to something you posted previously, about me currently living in Texas.. Really... look before you leap. You're showing your ignorance.
